B.1: Trace Tool Overview	236
B.2: Trace Tool Objects	237
C: Objects By Function	243
D: Objects By Index ID	253

ABOUT THIS MANUAL

Overview and Scope

This manual describes the CANopen implementation developed by Copley Controls for the Accelnet, Xenus, R-Series, and Stepnet amplifiers. It contains useful information for anyone who participates in the evaluation or design of a distributed motion control system. The reader should have prior knowledge of motion control, networks, and CANopen.

Related Documentation

Readers of this book should also read information on CAN and CANopen at the “CAN in Automation” website at <http://www.can-cia.org/index.php?id=530>.

Those interested in [Running CAM Tables from RAM](#) (p. 229) should also see the *Copley Camming User Guide*.

Information on Copley Controls Software can be found at:
<http://www.copleycontrols.com/Motion/Products/Software/index.html>

Comments

Copley Controls welcomes your comments on this manual.
See <http://www.copleycontrols.com> for contact information.

Copyrights

No part of this document may be reproduced in any form or by any means, electronic or mechanical, including photocopying, without express written permission of Copley Controls. Accelnet, Stepnet, Xenus, and CME 2 are registered trademarks of Copley Controls.

Document Validity

We reserve the right to modify our products. The information in this document is subject to change without notice and does not represent a commitment by Copley Controls. Copley Controls assumes no responsibility for any errors that may appear in this document.

Product Warnings

WARNING

Use caution in designing and programming machines that affect the safety of operators.

The programmer is responsible for creating program code that operates safely for the amplifiers and motors in any given machine.

Failure to heed this warning can cause equipment damage, injury, or death.

Revision History

Revision	Date	ECO #	Comments
1.0	Oct, 2002		Initial publication.
2.0	Dec, 2003		Added descriptions of new objects to support stepper mode and profile velocity mode operation, additional homing methods, and amplifier configuration.
2.1	Jan, 2004		Various minor edits and updates.
2.2	March, 2004		Added information about emergency message (EMCY) and memory storage options for objects.
3	June, 2006		Added information on EMCY Message Error Codes (p. 41), a new Camming mode and an object for reading/writing CVM Indexer Program registers (see Alternative Control Sources , p. 221), a new Trace Tool (p. 233), and a new Profile Torque Mode Operation (p. 197). Also, instructions for Ending an Interpolated Position Move (p. 210).
4	June, 2008	16591	Various updates, including Web page references and details on Running CAM Tables from RAM (p. 231).
5	October, 2008	17339	Various updates.
6	July, 2011	40588	Various updates and additions.

Object Description Conventions

Object descriptions in this manual look like the samples shown below. Each description includes a table of summary information.

SERVER SDO PARAMETERS

INDEX 0x1200

Type	Access	Units	Range	Map PDO	Memory
Record	RO	-	-	NO	-

Description

Holds the COB-ID (communication object ID, also known as CAN message ID) values used to access the amplifier's SDO. Sub-index 0 contains the number of sub-elements of this record.

SDO RECEIVE COB-ID

INDEX 0x1200, SUB-INDEX 1

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	0x600-0x67f	NO	-

Description

CAN object ID used by the amplifier to receive SDO packets. The value is 0x600 + the amplifier's CAN node ID.

Sub-Index Object Relationships

This manual describes objects and sub-index objects. Object descriptions are set off by bold type and a heavy separator line. Sub-index object descriptions have regular typeface and a thinner line. Sub-index object 0 always contains the number of elements contained by the record.

Object Summary Description Fields

Field Name	Description
Type	The object type (i.e., Unsigned 32, Integer, String).
Access	The object's access type: <ul style="list-style-type: none"> • RO for read only • WO for write only • RW for read and write • RC for read and clear
Units	The units used to express the object's value.
Range	The acceptable range of values if less than that specified by Type.
Map PDO	YES if the object can be mapped to a PDO. NO if it cannot. EVENT if the object can be mapped and set to event triggering.
Memory	Some objects can be held in the amplifier's flash memory (F), some in RAM (R), and some in RAM and flash (RF). If an object cannot be stored, or if the object contains sub-index objects, the Memory field contains a dash (-).

CHAPTER

1: INTRODUCTION

This chapter discusses how Copley Controls supports the use of CANopen to provide distributed motion control.

Contents include:

1.1: CAN and CANopen	12
1.2: Defining and Accessing CANopen Devices	17
1.3: Objects that Define SDOs and PDOs	30

1.1: CAN and CANopen

Contents of this Section

This section describes Copley Controls' use of CANopen and the underlying Controller Area Network (CAN).

Topics include:

Copley Controls Amplifiers in CANopen Networks	13
Overview of the CAN Protocol	14
The CAN Message.....	15
Overview of the CANopen Profiles.....	16

Copley Controls Amplifiers in CANopen Networks

Copley's CANopen Amplifiers

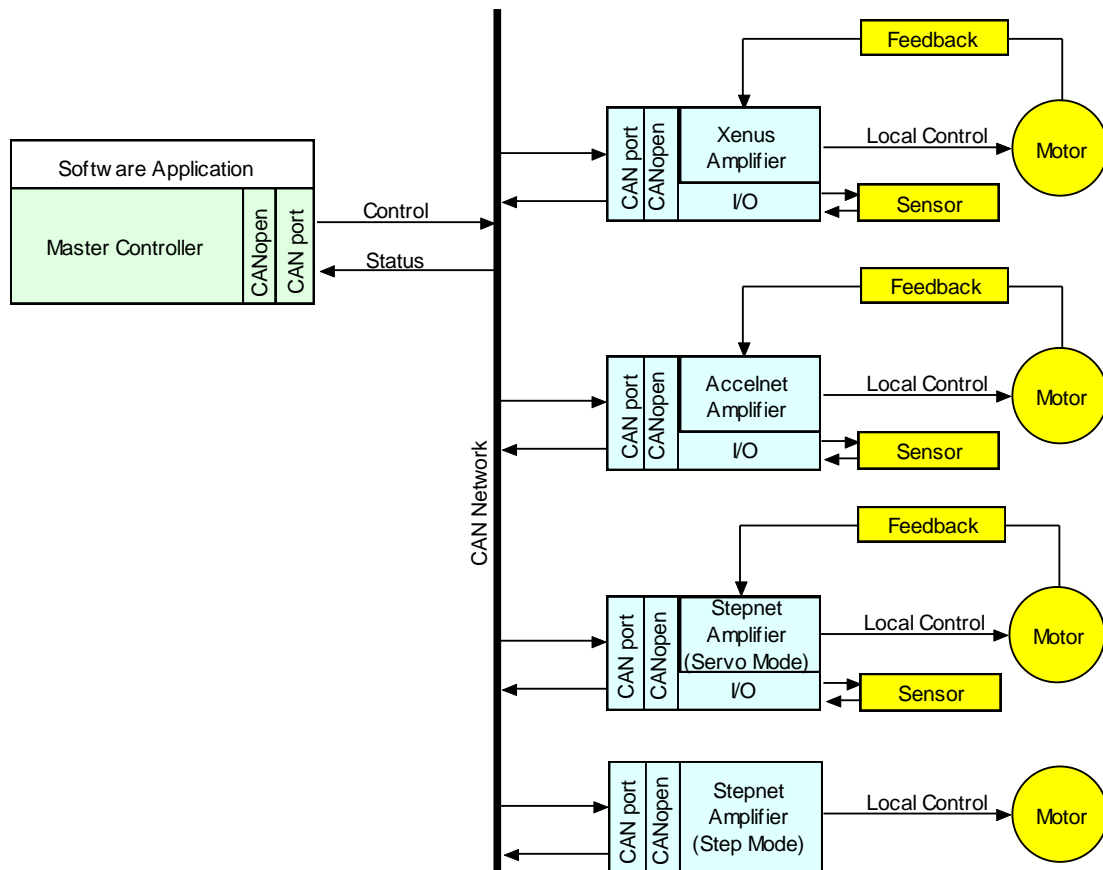

Several lines of Copley Controls amplifiers, including Accelnet, Stepnet, Xenus, and the ruggedized R-Series, offer distributed motion control through support of the Controller Area Network (CAN) and the CANopen network profiles. Using CANopen, the amplifiers can take instruction from a master application to perform homing operations, point-to-point motion, profile velocity motion, profile torque, and interpolated motion. (These amplifiers also support serial communication.)

CAN and CANopen

CAN specifies the data link and physical connection layers of a fast, reliable network. The CANopen profiles specify how various types of devices, including motion control devices, can use the CAN network in a highly efficient manner.

Architecture

As illustrated below, in a CANopen motion control system, control loops are closed on the individual amplifiers, not across the network. A master application coordinates multiple devices, using the network to transmit commands and receive status information. Each device can transmit to the master or any other device on the network. CANopen provides the protocol for mapping device and master internal commands to messages that can be shared across the network.

A CANopen network can support up to 127 nodes. Each node has a seven-bit node ID in the range of 1-127. (Node ID 0 is reserved and should not be used.)

Example of a CANopen Move Sequence

- CANopen master transmits a control word to initialize all devices.
- Devices transmit messages indicating their status (in this example, all are operational).
- CANopen master transmits a message instructing devices to perform homing operations.
- Devices indicate that homing is complete.
- CANopen master transmits messages instructing devices to enter position profile mode (point-to-point motion mode) and issues first set of point-to-point move coordinates.
- Devices execute their moves, using local position, velocity, and current loops, and then transmit actual position information back to the network.
- CANopen master issues next set of position coordinates.

Overview of the CAN Protocol

A Network for Distributed Control

The backbone of CANopen is CAN, a serial bus network originally designed by Robert Bosch GmbH to coordinate multiple control systems in automobiles.

The CAN model lends itself to distributed control. Any device can broadcast messages on the network. Each device receives all messages and uses filters to accept only the appropriate messages. Thus, a single message can reach multiple nodes, reducing the number of messages that need to be sent. This also greatly reduces bandwidth required for addressing, allowing distributed control at real-time speeds across the entire system.

CAN Benefits

Other benefits of CAN include:

- Wide use of CAN in automobiles and many other industries assures availability of inexpensive hardware and continued support. Ready availability of standard components also reduces system design effort.
- CAN's relative simplicity reduces training requirements.
- By distributing control to devices, CAN eliminates the need for multiple wire connections between devices and a central controller. Fewer connections enable increased reliability in harsh operating conditions.
- Device-based error checking and handling methods make CAN networks even more reliable.

Physical Layer

The physical layer of CAN is a differentially driven, two-wire bus, terminated by 124-Ohm resistors at each end. The maximum bit rate supported by CAN is 1,000,000 bits/second for up to 25 meters. Lower bit rates may be used for longer network lengths.

The CAN Message

Overview

CANopen messages are transmitted within CAN messages (a CAN message is also known as a communication object or COB).

CAN Message Format

CAN messages are communicated over the bus in the form of network packets. Each packet consists of an identifier (CAN message ID), control bits, and zero to eight bytes of data.

CRC Error Checking

Each packet is sent with CRC (cyclic redundancy check) information to allow controllers to identify and re-send incorrectly formatted packets.

CAN Message ID

Every CAN message has a CAN message ID (also known as COB-ID). The message ID plays two important roles.

- It provides the criteria by which the message is accepted or rejected by a node.
- It determines the message's priority, as described below.

CAN Message Priority

The priority of a CAN message is encoded in the message ID. The lower the value of the message ID, the higher the priority of the message. When two or more devices attempt to transmit packets at the same time, the packet with the highest priority succeeds. The other devices back off and retry.

This method of collision handling allows for a high bandwidth utilization compared to other network technologies. For instance, Ethernet handles collisions by requiring both devices to abort transmission and retry.

For More Information

For more information on the CAN protocol, see *CAN Specification 2.0*, Robert Bosch GmbH, and ISO 11898, *Road Vehicles, Interchange of Digital Information, Controller Area Network (CAN) for high-speed communication*.

Overview of the CANopen Profiles

Communication and Device Profiles

CANopen is a set of profiles built on a subset of the CAN application layer protocol. The CANopen profiles achieve two basic objectives:

- They specify methods for packaging multiple CAN messages to send large blocks of data as a single entity.
- They standardize and simplify communication between devices within several application types, including motion control.

Developed by the CAN In Automation (CiA) group, CANopen includes the underlying *CANopen Application Layer and Communication Profile (DS 301)* and several device profiles, including *CANopen Profile for Drives and Motion Control (DSP 402)*.

Communication Profile

The *Application Layer and Communication Profile* describes the communication techniques used by devices on the network. All CANopen applications must implement this profile.

Profile for Drives and Motion Control

Each of the CANopen device profiles describes a standard device for a certain application. Copley Controls CANopen amplifiers comply with the *Profile for Drives and Motion Control*. This profile specifies a state machine and a position control function. It also supports several motion control modes, including:

- Homing
- Profile position
- Profile velocity
- Profile torque
- Interpolated position
- Cyclic synchronous position
- Cyclic synchronous velocity
- Cyclic synchronous torque

The amplifier's operating mode is set using the [Mode Of Operation](#) object (index [0x6060](#), p. [64](#)).

(The *Profile for Drives and Motion Control* also supports other modes that are not supported by Copley Controls amplifiers at this time.)

1.2: Defining and Accessing CANopen Devices

Contents of this Section

This section describes the objects and methods used to configure and control devices on a CANopen network.

Topics include:

Defining a Device: CANopen Objects and Object Dictionaries.....	18
Accessing the Object Dictionary	20
SDOs: Description and Examples.....	22
PDOs: Description and Examples.....	24
SDO vs. PDO: Design Considerations.....	27
How to Map (or Remap) a PDO	28

Defining a Device: CANopen Objects and Object Dictionaries

Objects and Dictionaries

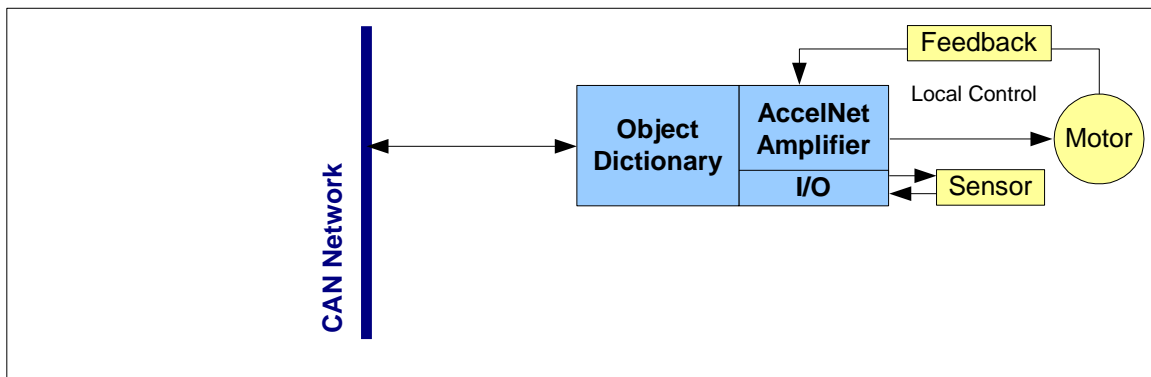

The primary means of controlling a device on a CANopen network is by writing to device parameters, and reading device status information. For this purpose, each device defines a group of parameters that can be written, and status values that can be read. These parameters and status values are collectively referred to as the device's objects.

These objects define and control every aspect of a device's identity and operation. For instance, some objects define basic information such as device type, model, and serial number. Others are used to check device status and deliver motion commands.

The entire set of objects defined by a device is called the device's object dictionary. Every device on a CANopen network must define an object dictionary, and nearly every CANopen network message involves reading values from or writing values to the object dictionaries of devices on the network.

Object Dictionary as Interface

The object dictionary is an interface between a device and other entities on the network.

CANopen Profiles and the Object Dictionary

The CANopen profiles specify the mandatory and optional objects that comprise most of an object dictionary. The Communication Profile specifies how all devices must communicate with the CAN network. For instance, the Communication Profile specifies dictionary objects that set up a device's ability to send and receive messages. The device profiles specify how to access particular functions of a device. For instance, the *CANopen Profile for Drives and Motion Control (DSP 402)* specifies objects used to control device homing and position control.

In addition to the objects specified in the *Application Layer and Communication Profile* and device profiles, CANopen allows manufacturers to add device-specific objects to a dictionary.

Object Dictionary Structure

An object dictionary is a lookup table. Each object is identified by a 16-bit index with an eight-bit sub-index. Most objects represent simple data types, such as 16-bit integers, 32-bit integers, and strings. These can be accessed directly by the 16-bit index.

Other objects use the sub-index to represent groups of related parameters. For instance, the [Motor Data](#) object (index [0x2383](#), p. [91](#)) has 24 sub-index objects defining basic motor characteristics such as motor type, motor wiring configuration, and Hall sensor type. (The sub-index provides up to 255 subentries for each index.)

The organization of the dictionary is specified in the profiles, as shown below.

Index Range	Objects
0000	not used
0001-001F	Static Data Types
0020-003F	Complex Data Types
0040-005F	Manufacturer Specific Complex Data Types
0060-007F	Device Profile Specific Static Data Types (including those specific to motion control)
0080-009F	Device Profile Specific Complex Data Types (including those specific to motion control)
00A0-0FFF	Reserved for future use
1000-1FFF	Communication Profile Area (DS 301)
2000-5FFF	Manufacturer Specific Profile Area
6000-9FFF	Standardized Device Profile Area (including Profile for Motion Control)
A000-FFFF	Reserved for further use

Accessing the Object Dictionary

Two Basic Channels

CANopen provides two ways to access a device's object dictionary:

- The Service Data Object (SDO)
- The Process Data Object (PDO)

Each can be described as a channel for access to an object dictionary.

SDOs and PDOs

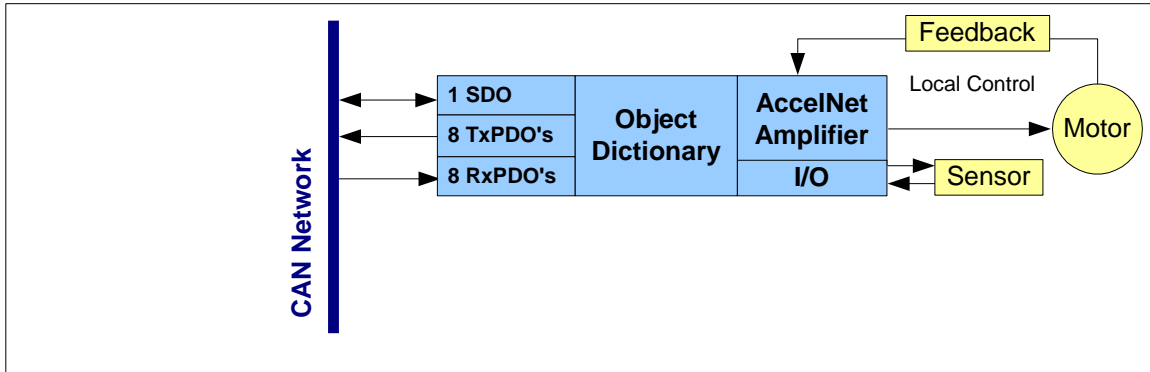

Here are the basic characteristics of PDOs and SDOs.

SDO	PDO
The SDO protocol allows any object in the object dictionary to be accessed, regardless of the object's size. This comes at the cost of significant protocol overhead.	One PDO message can transfer up to eight bytes of data in a CAN message. There is no additional protocol overhead for PDO messages.
Transfer is always confirmed.	PDO transfers are unconfirmed.
Has direct, unlimited access to the object dictionary.	Requires prior setup, wherein the CANopen master application uses SDOs to map each byte of the PDO message to one or more objects. Thus, the message itself does not need to identify the objects, leaving more bytes available for data.
Employs a client/server communication model, where the CANopen master is the sole client of the device object dictionary being accessed.	Employs a peer-to-peer communication model. Any network node can initiate a PDO communication, and multiple nodes can receive it.
An SDO has two CAN message identifiers: a transmit identifier for messages from the device to the CANopen master, and a receive identifier for messages from the CANopen master.	Transmit PDOs are used to send data from the device, and receive PDOs are used to receive data.
SDOs can be used to access the object dictionary directly.	A PDO can be used only after it has been configured using SDO transfers.
Best suited for device configuration, PDO mapping, and other infrequent, low priority communication between the CANopen master and individual devices. Such transfers tend to involve the setting up of basic node services; thus, the term service data object .	Best suited for high-priority transfer of small amounts of data, such as delivery of set points from the CANopen master or broadcast of a device's status. Such transfers tend to relate directly to the application process; thus, the term process data object .
For more information about SDOs, see SDOs: Description and Examples , p. 22.	For more information about PDOs, see PDOs: Description and Examples , p. 24.
For help deciding whether to use an SDO or a PDO see SDO vs. PDO: Design Considerations , p. 27.	

Copley SDOs and PDOs

The Communication Profile requires the support of at least one SDO per device. (Without an SDO, there would be no way to access the object dictionary.) It also specifies default parameters for four PDOs.

Copley Controls CANopen amplifiers each support 1 SDO and 16 PDOs (eight transmit PDOs and eight receive PDOs).

SDOs: Description and Examples

Overview

Each amplifier provides one SDO. The CANopen master can use this SDO to configure, monitor, and control the device by reading from and writing to its object dictionary.

SDO CAN Message IDs

The SDO protocol uses two CAN message identifiers. One ID is used for messages sent from the CANopen master (SDO client) to the amplifier (SDO server). The other ID is used for messages sent from the SDO server to the SDO client.

The CAN message ID numbers for these two messages are fixed by the CANopen protocol. They are based on the device's node ID (which ranges from 1 to 127). The ID used for messages from the SDO client to the SDO server (i.e. from the CANopen master to the amplifier) is the hex value 0x600 + the node ID. The message from the SDO server to the SDO client is 0x580 + the node ID. For example, an amplifier with node ID 7 uses CAN message IDs 0x587 and 0x607 for its SDO protocol.

Client/ Server Communication

The SDO employs a client/server communication model. The CANopen master is the sole client. The device is the server. The CANopen master application should provide a client SDO for each device under its control.

The CAN message ID of an SDO message sent from the CANopen master to a device should match the device's receive SDO message identifier. In response, the CANopen master should expect an SDO message whose CAN message ID matches the device's transmit SDO message identifier.

SDO Message Format

The SDO uses a series of CAN messages to send the segments that make up a block of data. The full details of the SDO protocol are described in the *CANopen Application Layer and Communication Profile*.

Confirmation

Because an SDO transfer is always confirmed, each SDO transfer requires at least two CAN messages (one from the master and one from the slave).

Confirmation Example

For instance, updating an object that holds an eight-byte long value requires six CAN messages:

- 1 The master sends a message to the device indicating its intentions to update an object in the device's dictionary. The message includes the object's index and sub-index values as well as the size (in bytes) of the data to be transferred.
- 2 The device responds to the CANopen master indicating that it is ready to receive the data.
- 3 The CANopen master sends one byte of message header information and the first 7 bytes of data. (Because SDO transfers use one byte of the CAN message data for header information, the largest amount of data that can be passed in any single message is 7 bytes.)
- 4 The device responds indicating that it received the data and is ready for more.
- 5 The CANopen master sends the remaining byte of data along with the byte of header information.
- 6 The device responds indicating success.

Segmented, Expedited and Block Transfers

As in the example above, most SDO transfers consist of an initiate transfer request from the client, followed by series of confirmed eight-byte messages. Each message contains one byte of header information and a segment (up to seven bytes long) of the data being transferred.

For the transfer of short blocks of data (four bytes or less), the Communication Profile specifies an expedited SDO method. The entire data block is included in the initiate SDO message (for downloads) or in the response (for uploads). Thus, the entire transfer is completed in two messages.

The Communication Profile also describes a method called block SDO transfers, where many segments can be transferred with a single acknowledgement at the end of the transfer. Copley Controls CANopen amplifiers do not require use of the block transfer protocol.

PDOs: Description and Examples

Overview

Each amplifier provides eight transmit PDOs and eight receive PDOs. A transmit PDO is used to transmit information from the device to the network. A receive PDO is used to update the device.

Default PDO Message Identifiers

The Communication Profile reserves four CAN message identifiers for transmit PDOs and four identifiers for receive PDOs. These addresses are described later in this chapter (see [Receive PDO Communication Parameters](#), p. 31, and [Transmit PDO Communication Parameters](#), p. 35).

The first four transmit PDOs and receive PDOs provided in Copley Controls CANopen amplifiers use these default addresses. The addresses of the remaining four transmit PDOs and receive PDOs are null by default.

The designer can reconfigure any PDO message identifier.

PDO Peer- to-Peer Communication

Peer-to-peer relationships are established by matching the transmit PDO identifier of the sending node to a receive PDO identifier of one or more other nodes on the network.

Any device can broadcast a PDO message using one of its eight transmit PDOs. The CAN identifier of the outgoing message matches the ID of the sending PDO. Any node with a matching receive PDO identifier will accept the message.

PDO Peer-to- Peer Example

For instance, Node 1, transmit PDO 1, has a CAN message ID of 0x0189. Node 2, receive PDO 1 has a matching ID, as does Node 3. They both accept the message. Other nodes do not have a matching receive PDO, so no other nodes accept the message.

PDO Mapping

PDO mapping allows optimal use of the CAN message's eight-byte data area.

Mapping uses the SDO to configure dictionary objects in both the sending and the receiving node to know, for each byte in the PDO message:

- The index and sub-index which objects are to be accessed
- The type of data
- The length of the data

Thus, the PDO message itself carries no transfer control information, leaving all eight bytes available for data. (Contrast this with the SDO, which uses one byte of the CAN message data area to describe the objects being written or read, and the length of the data.)

Mappable Objects

Not all objects in a device's object dictionary can be mapped to a PDO. If an object can be mapped to a PDO, the MAP PDO field in the object's description in this manual contains the word **EVENT** or the word **YES**.

Dynamic PDO Mapping

Copley supports the CANopen option of dynamic PDO mapping, which allows the CANopen master to change the mapping of a PDO during operation. For instance, a PDO might use one mapping in Homing Mode, and another mapping in Profile Position Mode.

PDO Transmission Modes

PDOs can be sent in one of two transmission modes:

- **Synchronous.** Messages are sent only after receipt of a specified number of synchronization (SYNC) objects, sent at regular intervals by a designated synchronization device. (For more information on the SYNC object, see [SYNC and High-resolution Time Stamp Messages](#), p. 42.)

- **Asynchronous.** The receipt of SYNC messages does not govern message transmission.

Synchronous transmission can be cyclic, where the message is sent after a predefined number of SYNC messages, or acyclic, where the message is triggered by some internal event but does not get sent until the receipt of a SYNC message.

PDO Triggering Modes

The transmission of a transmit PDO message from a node can be triggered in one of three ways:

Trigger	Description
Event	Message transmission is triggered by the occurrence of an object specific event. For synchronous PDOs this is the expiration of the specified transmission period, synchronized by the reception of the SYNC object. For acyclically transmitted synchronous PDOs and asynchronous PDOs the triggering of a message transmission is a device-specific event specified in the device profile.
SYNC message	For synchronous PDOs, the message is transmitted after a specified number of SYNC cycles have occurred.
Remote Request	The transmission of an asynchronous PDO is initiated on receipt of a remote request initiated by any other device.

Default PDO Mappings

Copley Controls CANopen amplifiers are shipped with the default PDO mappings specified in the *Profile for Drives and Motion Control*. These mappings are:

RECEIVE PDOs		TRANSMIT PDOs	
PDO	Default mapping	PDO	Default mapping
1	0x6040 (Control Word)	1	0x6041 (Status Word)
2	0x6040, 0x6060 (Mode Of Operation)	2	0x 6041, 0x 6061
3	0x6040, 0x607A (Target Position)	3	0x 6041, 0x6064 (Position Actual Value)
4	0x6040, 0x60FF (Target Velocity)	4	0x 6041, 0x606C (Actual Velocity)
5	0x6040, 0x6071 (Target Torque)	5	0x 6041, 0x6077 (Torque Actual Value)
6	0x6040	6	0x 6041
7	0x6040	7	0x 6041, 0x60FD (Digital Inputs)
8	0x6040, 0x6060	8	no default mapping

For more information see the *CANopen Profile for Drives and Motion Control (DSP 402)*.

PDO Examples

The designer has broad discretion in the use of PDOs. For example:

- On the device designated as the SYNC message and time stamp producer, map a transmit PDO to transmit the high-resolution time stamp message on a periodic basis. Map receive PDOs on other devices to receive this object.
- On each amplifier, map a transmit PDO to transmit PVT buffer status updates in interpolated position mode. Map a receive PDO to receive PVT segments.
- Another transmit PDO could transmit general amplifier status updates.

The Copley Controls CANopen Motion Libraries product (CML) uses these default mappings:

RECEIVE PDOs		TRANSMIT PDOs	
PDO	Default mapping	PDO	Default mapping
1	IP move segment command (index 0x2010 , p. 213). Used to receive the PVT segments.	4	Trajectory Buffer Status object (index 0x2012 , p. 215). This is also used with transmission type 255. The PDO will be transmitted each time a segment is read from the buffer, or on an error condition.
5	High-resolution Time Stamp (index 0x1013 , p. 47) on the amplifier designated as the time-stamp transmitter. CML programs this object with transmit type 10 (transmit every 10 sync cycles). The sync cycle is 10 milliseconds. Thus, the timestamp is transmitted every 100 milliseconds.	5	High-resolution Time Stamp (index 0x1013 , p. 47) on all but the time-stamp transmitter.
		2	Various status information: Status Word (index 0x6041 , p. 58), Manufacturer Status Register object (index 0x1002 , p. 60), and Input Pin States (index 0x2190 p. 116). CML programs this PDO to transmit on an event (transmission type 255). This causes the PDO to be transmitted any time an input pin changes or a status bit changes. Note that Copley input pins have a programmable debounce time, so if one of the inputs is connected to something that might change rapidly, then the debounce time can be used to keep it from overloading the CANopen network.

SDO vs. PDO: Design Considerations

Differences Between SDO and PDO

As stated earlier, SDOs and PDOs can both be described as channels through which CAN messages are sent, and both provide access to a device's object dictionary, but each has characteristics that make it more appropriate for certain types of data transfers.

Here is a review of the differences between SDOs and PDOs, and some design considerations indicated by those differences:

SDO	PDO	Design Considerations
The accessed device always confirms SDO messages. This makes SDOs slower.	PDO messages are unconfirmed. This makes PDOs faster.	To transfer 8 bytes or less at real-time speed, use a PDO. For instance, to receive control instructions and transmit status updates. To transfer large amounts of low priority data, use the SDO. Also, if confirmation is absolutely required, use an SDO.
One SDO transfer can send long blocks of data, using as many CAN messages as required.	A PDO transfer can only send small amounts of data (up to eight bytes) in a single CAN message. Mapping allows very efficient use of those eight bytes.	
Asynchronous.	Synchronous or asynchronous. Cyclic or acyclic.	Use PDO when synchronous or broadcast communications are required. For instance, to communicate set points from the master to multiple devices for a multi-axis move, or to have a device broadcast its status.
The SDO employs a client-server communication model. The CANopen master is the client. It reads from and writes to the object dictionaries of devices. The device being accessed is the server.	The PDO employs a peer-to-peer communication model. Any device can send a PDO message, and a PDO message can be received and processed by multiple devices.	
All communications can be performed through the SDO without using any PDOs.	The CANopen master application uses SDO messages to map the content of the PDO, at a cost of increased CPU cycles on the CANopen master and increased bus traffic.	If the application does not benefit from the use of a PDO for a certain transfer, consider using SDO to avoid the extra overhead. For instance, if an object's value is updated only once (as with many configuration objects), the SDO is more efficient. If the object's value is updated repeatedly, a PDO is more efficient.

How to Map (or Remap) a PDO

Process Overview

Two objects in the device's object dictionary define a PDO:

- A PDO's **communication object** defines the PDO's CAN message ID and its communication type (synchronous or asynchronous) and triggering type (event-drive or cyclic).
- A PDO's **mapping object** maps every data byte in the PDO message to an object in the device's object dictionary.

Mapping a PDO is the process of configuring the PDO's communication and mapping objects.

To Map a Receive PDO

The general procedure for mapping a receive PDO follows. (The procedure for mapping a transmit PDO is similar).

Stage	Step	Sub-steps/Comments
1	Disable the PDO.	In the PDO's mapping object (Receive PDO Mapping Parameters , index 0x1601), set the sub-index 0 (NUMBER OF MAPPED OBJECTS) to zero. This disables the PDO.
2	Set the communication parameters.	If necessary, set the PDO's CAN message ID (PDO COB-ID) using sub-index 1 of the PDO's RECEIVE PDO Communication Parameters (index 0x1401). Choose the PDO's transmission type (PDO TYPE) in sub-index 2 of object 0x1401. A value in the range [0-240] = synchronous; [254-255] = asynchronous.
3	Map the data.	Using the PDO's mapping parameters (sub-indexes 1-4 of Receive PDO Mapping Parameters , index 0x1601), you can map up to 4 objects (whose contents must total to no more than 8 bytes), as follows: In bits 0-7 of the mapping value, enter the size (in bits) of the object to be mapped, as specified in the object dictionary. In bits 8-15, enter the sub-index of the object to be mapped. Clear bits 8-15 if the object is a simple variable. In bits 16-31, enter the index of the object to be mapped.
4.	Set the number of mapped objects and enable the PDO.	In the PDO's Receive PDO Mapping Parameters (index 0x1601), set sub-index 0 (NUMBER OF MAPPED OBJECTS) to the actual number of objects mapped. This properly configures the PDO. Also, the presence of a non-zero value in the NUMBER OF MAPPED OBJECTS object enables the PDO.

Example: Mapping a Receive PDO

This example illustrates the general procedure for mapping a receive PDO. In the example, the second receive PDO is mapped to the device's **Control Word** object (index 0x6040, p. 58) to receive device state change commands and to the **Mode Of Operation** object (index 0x6060, p. 64) to receive mode change commands.

Stage	Step	Sub-steps/Comments
1	Disable the PDO.	In the PDO's mapping object (Receive PDO Mapping Parameters , index 0x1601), set the sub-index 0 (NUMBER OF MAPPED OBJECTS) to zero. This disables the PDO.
2	Set the communication parameters.	In this case, it is not necessary to set the CAN message ID of the PDO, because the default value is acceptable. In the PDO TYPE object (sub-index 2 of RECEIVE PDO Communication Parameters , index 0x1401) choose a value in the range [254-255] so that the PDO transmits immediately upon request (without waiting for a synchronization message).
3	Map the data.	<p>In the device's Receive PDO Mapping Parameters object (index 0x1601):</p> <p>1: To map the Control Word to the PDO, set object 1601, sub-index 1 to:</p> <div style="text-align: center;"> <p>0x6040 00 10</p> </div> <p>2: To map the Mode Of Operation object to the PDO, set sub-index 2 to:</p> <div style="text-align: center;"> <p>0x6060 00 08</p> </div>
4.	Set the number of mapped objects and enable the PDO.	In the PDO's Receive PDO Mapping Parameters object (index 0x1601), set sub-index 0 (NUMBER OF MAPPED OBJECTS) to 2, the actual number of objects mapped. This properly configures the PDO. Also, the presence of a non-zero value in the NUMBER OF MAPPED OBJECTS object enables the PDO.

1.3: Objects that Define SDOs and PDOs

Contents of this Section

This section describes objects and sub-index objects used to configure SDOs and PDOs. They include:

Server SDO Parameters	Index 0x1200.....	31
SDO Receive COB-ID	Index 0x1200, Sub-Index 1.....	31
SDO Transmit COB-ID	Index 0x1200, Sub-Index 2.....	31
Receive PDO Communication Parameters	Index 0x1400 – 0x1407	31
PDO COB-ID	Index 0x1400 – 7, Sub-Index 1.....	31
PDO Type	Index 0x1400 – 7, Sub-Index 2.....	32
Receive PDO Mapping Parameters	Index 0x1600 – 0x1607.....	32
Number Of Mapped Objects	Index 0x1600 – 7, Sub-index 0.....	32
PDO Mapping	Index 0x1600 – 7, Sub-Index 1 – 8.....	32
Receive PDO Mapping Parameters	Index 0x1700.....	33
Number Of Mapped Objects	Index 0x1700, Sub-index 0.....	33
PDO Mapping	Index 0x1700, Sub-Index 1 – 4.....	33
Receive PDO Mapping Parameters	Index 0x1701.....	34
Number Of Mapped Objects	Index 0x1701, Sub-index 0.....	34
PDO Mapping	Index 0x1701, Sub-Index 1 – 3.....	34
Receive PDO Mapping Parameters	Index 0x1702.....	34
Number Of Mapped Objects	Index 0x1702, Sub-index 0.....	34
PDO Mapping	Index 0x1702, Sub-Index 1 – 2.....	35
Transmit PDO Communication Parameters	Index 0x1800 – 0x1807	35
PDO COB-ID	Index 0x1800 – 7, Sub-index 1	35
PDO type	Index 0x1800 – 7, Sub-index 2.....	36
Transmit PDO Mapping Parameters	Index 0x1A00 – 0x1A07.....	37
Number Of Mapped Objects	Index 0x1A00 – 7, Sub-index 0	37
PDO Mapping	Index 0x1A00 – 7, Sub-Index 1 – 8	37
Transmit PDO Mapping Parameters	Index 0x1B00.....	38
Number Of Mapped Objects	Index 0x1B00, Sub-index 0	38
PDO Mapping	Index 0x1B00, Sub-Index 1 – 5	38

SERVER SDO PARAMETERS**INDEX 0x1200**

Type	Access	Units	Range	Map PDO	Memory
Record	RO	-	-	NO	-

Description

Holds the COB-ID (communication object ID, also known as CAN message ID) values used to access the amplifier's SDO. Sub-index 0 contains the number of sub-elements of this record.

SDO RECEIVE COB-ID**INDEX 0x1200, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	0x600-0x67f	NO	-

Description

CAN object ID used by the amplifier to receive SDO packets. The value is 0x600 + the amplifier's CAN node ID.

SDO TRANSMIT COB-ID**INDEX 0x1200, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	0x580-0x5ff	NO	-

Description

This value gives the CAN object ID used by the amplifier to transmit SDO packets. The value is 0x580 + the amplifier's CAN node ID.

RECEIVE PDO COMMUNICATION PARAMETERS**INDEX 0x1400 – 0x1407**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow configuration of the communication parameters of each of receive PDO. Sub-index 0 contains the number of sub-elements of this record.

PDO COB-ID**INDEX 0x1400 – 7, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See Default Values , below.	NO	R

Description

CAN message ID used by the PDO. The ID is formatted as follows:

Bit	Description
0-10	Give the 11-bit identifier for standard (CAN 2.0A) identifiers, or the lower 11 bits for extended (CAN 2.0B) identifiers.
11-28	Give the upper 18 bits of extended identifiers. For standard identifiers these bits should be written as zeros.
29	Defines the identifier format. This bit is clear for standard (11-bit) identifiers, and set for extended (29-bit) identifiers.
30	Reserved for future use.
31	Identifies the PDO as valid if clear. If set, the PDO is disabled and its mapping may be changed.

Default Values

The default values for this object are specified in the DS-301 CANopen specification. These values are:

Index	Default ID
0x1400	0x00000200 + amplifier CAN node ID.
0x1401	0x00000300 + amplifier CAN node ID.
0x1402	0x00000400 + amplifier CAN node ID.
Continued...	

...continued:	
0x1403	0x00000500 + amplifier CAN node ID.
0x1404	0x80000000
0x1405	0x80000000
0x1406	0x80000000
0x1407	0x80000000

PDO TYPE**INDEX 0x1400 – 7, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	See <i>Description</i> , below	NO	R

Description

This object controls the behavior of the PDO when new data is received. The following codes are defined for receive PDOs:

Code	Behavior
0-240	The received data is held until the next SYNC message. When the SYNC message is received the data is applied.
241-253	Reserved.
254-255	The received data is applied to its mapped objects immediately upon reception.

RECEIVE PDO MAPPING PARAMETERS**INDEX 0x1600 – 0x1607**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow the mapping of each of the receive PDO objects to be configured.

NUMBER OF MAPPED OBJECTS**INDEX 0x1600 – 7, SUB-INDEX 0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	0-4	NO	R

Description

This value gives the total number of objects mapped to this PDO. It can be set to 0 to disable the PDO operation, and must be set to 0 before changing the PDO mapping.

Once the PDO mapping has been established by configuring the objects in sub-indexes 1 – 4, this value should be updated to indicate the actual number of objects mapped to the PDO.

PDO MAPPING**INDEX 0x1600 – 7, SUB-INDEX 1 – 8**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below	NO	R

Description

When a PDO message is received, the data passed with the PDO message (up to 8 bytes) is used to update the objects mapped to the PDO. The values in the PDO mapping objects identify which object(s) the PDO data maps to. The first object is specified by the value in sub-index 1; the second object is identified by sub-index 2, etc.

Each of the PDO mapping values consist of a 32-bit value structured as follows:

Bit	Description
0-7	Size (in bits) of the object being mapped. Must match the actual object size as defined in the object dictionary.
8-15	Sub-index of the object to be mapped.
16-31	Index of the object to be mapped.

RECEIVE PDO MAPPING PARAMETERS**INDEX 0x1700**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow the mapping of each of the receive PDO objects to be configured.

NUMBER OF MAPPED OBJECTS**INDEX 0x1700, SUB-INDEX 0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	0-4	NO	R

Description

This value gives the total number of objects mapped to this PDO. Once the PDO mapping has been established by configuring the objects in sub-indexes 1 – 4, this value should be updated to indicate the actual number of objects mapped to the PDO.

PDO MAPPING**INDEX 0x1700, SUB-INDEX 1 – 4**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below	NO	R

Description

When a PDO message is received, the data passed with the PDO message (up to 8 bytes) is used to update the objects mapped to the PDO. The values in the PDO mapping objects identify which object(s) the PDO data maps to. The first object is specified by the value in sub-index 1; the second object is identified by sub-index 2, etc.

Each of the PDO mapping values consist of a 32-bit value structured as follows:

Bit	Description
0-7	Size (in bits) of the object being mapped. Must match the actual object size as defined in the object dictionary.
8-15	Sub-index of the object to be mapped.
16-31	Index of the object to be mapped.

Because Index 0x1700 is read only, the available mapped objects are fixed. They include the following:

Sub-index	Value	Description
0	4	Number of mapped objects.
1	0x60400010	Control word
2	0x607A0020	Target position
3	0x60B10020	Offset added to the velocity command in CSP or CSV mode.
4	0x60B20010	Offset added to the torque command in CSP, CSV or CST modes.

RECEIVE PDO MAPPING PARAMETERS**INDEX 0x1701**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow the mapping of each of the receive PDO objects to be configured.

NUMBER OF MAPPED OBJECTS**INDEX 0x1701, SUB-INDEX 0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	0-4	NO	R

Description

This value gives the total number of objects mapped to this PDO. Once the PDO mapping has been established by configuring the objects in sub-indexes 1 – 3, this value should be updated to indicate the actual number of objects mapped to the PDO.

PDO MAPPING**INDEX 0x1701, SUB-INDEX 1 – 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below	NO	R

Description

When a PDO message is received, the data passed with the PDO message (up to 8 bytes) is used to update the objects mapped to the PDO. The values in the PDO mapping objects identify which object(s) the PDO data maps to. The first object is specified by the value in sub-index 1; the second object is identified by sub-index 2, etc.

Each of the PDO mapping values consist of a 32-bit value structured as follows:

Bit	Description
0-7	Size (in bits) of the object being mapped. Must match the actual object size as defined in the object dictionary.
8-15	Sub-index of the object to be mapped.
16-31	Index of the object to be mapped.

Because Index 0x1701 is read only, the available mapped objects are fixed. They include the following:

Sub-index	Value	Description
0	3	Number of mapped objects.
1	0x60400010	Control word
2	0x60FF0020	Target velocity
3	0x60B20010	Offset added to the torque command in CSP, CSV or CST modes.

RECEIVE PDO MAPPING PARAMETERS**INDEX 0x1702**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow the mapping of each of the receive PDO objects to be configured.

NUMBER OF MAPPED OBJECTS**INDEX 0x1702, SUB-INDEX 0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	0-4	NO	R

Description

This value gives the total number of objects mapped to this PDO. Once the PDO mapping has been established by configuring the objects in sub-indexes 1 – 4, this value should be updated to indicate the actual number of objects mapped to the PDO.

PDO MAPPING**INDEX 0x1702, SUB-INDEX 1 – 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below	NO	R

Description

When a PDO message is received, the data passed with the PDO message (up to 8 bytes) is used to update the objects mapped to the PDO. The values in the PDO mapping objects identify which object(s) the PDO data maps to. The first object is specified by the value in sub-index 1; the second object is identified by sub-index 2, etc.

Each of the PDO mapping values consist of a 32-bit value structured as follows:

Bit	Description
0-7	Size (in bits) of the object being mapped. Must match the actual object size as defined in the object dictionary.
8-15	Sub-index of the object to be mapped.
16-31	Index of the object to be mapped.

Because Index 0x1702 is read only, the available mapped objects are fixed. They include the following:

Sub-index	Value	Description
0	2	Number of mapped objects.
1	0x60400010	Control word
2	0x60710010	Target torque

TRANSMIT PDO COMMUNICATION PARAMETERS**INDEX 0x1800 – 0x1807**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow configuration of communication parameters of each transmit PDO object. Sub-index 0 contains the number of sub-elements of this record.

PDO COB-ID**INDEX 0x1800 – 7, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See Default Values , below.	NO	R

Description

This object holds the CAN object ID used by the PDO. The ID is formatted as follows:

Bit	Description
0-10	11-bit identifier for standard (CAN 2.0A) identifiers, or the lower 11 bits for extended (CAN 2.0B) identifiers.
11-28	Upper 18 bits of extended identifiers. For standard identifiers these bits should be written as zeros.
29	Identifier format. This bit is clear for standard (11-bit) identifiers, and set for extended (29-bit) identifiers.
30	If set, remote transmit requests (RTR) are not allowed on this PDO. If clear, the PDO is transmitted in response to a remote request.
31	Identifies the PDO as valid if clear. If set, the PDO is disabled and its mapping may be changed.

Default Values

The default values for this object are specified in the DS-301 CANopen specification. These values are:

Index	Default ID
0x1800	0x00000180 + amplifier CAN node ID.
0x1801	0x00000280 + amplifier CAN node ID.
0x1802	0x00000380 + amplifier CAN node ID.
0x1803	0x00000480 + amplifier CAN node ID.
0x1804	0x80000000
0x1805	0x80000000
0x1806	0x80000000
0x1807	0x80000000

PDO TYPE

INDEX 0x1800 – 7, SUB-INDEX 2

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	See <i>Description</i> , below	EVENT	R

Description

This object identifies which events trigger a PDO transmission:

Code	Behavior
0	The PDO is transmitted on the next SYNC message following a PDO event. See PDO Events , below, for a description of a PDO event.
1-240	The PDO is transmitted every N SYNC messages, where N is the PDO type code. For example, a PDO with type code 7 would be transmitted on every 7th SYNC message.
241-251	Reserved.
252	The PDO is transmitted on the SYNC message following a remote request.
253	The PDO is transmitted immediately in response to a remote request.
254-255	The PDO is transmitted immediately in response to an internal PDO event.

PDO Events

Some objects in the object dictionary have special PDO events associated with them. If such an object is mapped to a transmit PDO, then the PDO may be configured with a code that relies on this event to trigger its transmission. The codes that use PDO events are 0 and 255.

An example of an object that has a PDO event associated with it is the Device Status object (index 0x6041). This object triggers an event to any mapped transmit PDO each time its value changes. A transmit PDO which included this object in its mapping would have its event signaled each time the status register changed.

Most objects in the object dictionary do not have PDO events associated with them. Those that do are identified by the word **EVENT** in the *PDO Mapping* fields of their descriptions.

TRANSMIT PDO MAPPING PARAMETERS**INDEX 0x1A00 – 0x1A07**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow the mapping of each of the transmit PDO objects to be configured.

NUMBER OF MAPPED OBJECTS**INDEX 0x1A00 – 7, SUB-INDEX 0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	0-4	NO	R

Description

Total number of objects mapped to this PDO. It can be set to 0 to disable the PDO operation, and must be set to 0 before changing the PDO mapping.

Once the PDO mapping has been established by configuring the objects in sub-indexes 1 – 4, this value should be updated to indicate the actual number of objects mapped to the PDO.

PDO MAPPING**INDEX 0x1A00 – 7, SUB-INDEX 1 – 8**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below	NO	R

Description

When a PDO message is transmitted, the data passed with the PDO message (up to 8 bytes) is gathered from the objects mapped to the PDO. The values in the PDO Mapping objects identify which object(s) the PDO data maps to. The first object is specified by the value in sub-index 1; the second object is identified by sub-index 2, etc.

Each of the PDO mapping values consist of a 32-bit value structured as follows:

Bit	Description
0-7	Size (in bits) of the object being mapped. This value must match the actual object size as defined in the object dictionary.
8-15	Sub-index of the object to be mapped.
16-31	Index of the object to be mapped.

TRANSMIT PDO MAPPING PARAMETERS**INDEX 0x1B00**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

These objects allow the mapping of each of the transmit PDO objects to be configured.

NUMBER OF MAPPED OBJECTS**INDEX 0x1B00, SUB-INDEX 0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	0-4	NO	R

Description

Total number of objects mapped to this PDO. Once the PDO mapping has been established by configuring the objects in sub-indexes 1 – 4, this value should be updated to indicate the actual number of objects mapped to the PDO.

PDO MAPPING**INDEX 0x1B00, SUB-INDEX 1 – 5**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below	NO	R

Description

When a PDO message is transmitted, the data passed with the PDO message (up to 8 bytes) is gathered from the objects mapped to the PDO. The values in the PDO Mapping objects identify which object(s) the PDO data maps to. The first object is specified by the value in sub-index 1; the second object is identified by sub-index 2, etc.

Each of the PDO mapping values consist of a 32-bit value structured as follows:

Bit	Description
0-7	Size (in bits) of the object being mapped. This value must match the actual object size as defined in the object dictionary.
8-15	Sub-index of the object to be mapped.
16-31	Index of the object to be mapped.

Because Index 0x1B00 is read only, the objects that can be mapped are fixed. The available mapped objects are as follows:

Sub-index	Value	Description
0	4	Number of mapped objects.
1	0x60400010	Control word
2	0x60640020	Actual position
3	0x60F40020	Position error
4	0x606C0020	Actual velocity
5	0x60770010	Actual torque

CHAPTER

2: NETWORK MANAGEMENT

This chapter describes the messages, methods, and objects used to manage devices on a CANopen network.

Contents include:

2.1: Network Management Overview.....	40
2.2: Network Management Objects.....	45

2.1: Network Management Overview

Contents of this Section

This section describes the objects, messages, and methods used to control the CANopen network.

Topics include:

General Device State Control	41
Device Monitoring	42
SYNC and High-resolution Time Stamp Messages	42
Emergency Messages	42

Overview

Network Management Services and Objects

Network management services on the CANopen network include device state control, device monitoring, synchronization, and emergency handling. Special communication objects, as summarized below, provide these services.

Object	Description
Network Management (NMT)	This object provides services to control the state of the device, including the initialization, starting, monitoring, resetting, and stopping of nodes. It also provides device-monitoring services (node-guarding and heartbeat).
Synchronization (SYNC)	Broadcast periodically by a specified device or the CANopen master to allow synchronized activity among multiple devices. The CAN message ID of the SYNC message is 80.
Time Stamp	Broadcast periodically by a specified device or the CANopen master to allow devices to synchronize their clocks.
Emergency	Transmitted by a device when an internal error occurs.

Network Manager Node

Normally, a single node (such as a PC) is designated as the network manager. The network manager runs the software that issues all NMT messages. The network manager node can be the same node that runs the CANopen master application.

General Device State Control

State Machine

Every CANopen device implements a simple state machine. The machine defines three states (described below). The network manager application uses NMT messages to interact with the state machine and control state changes.

Device States

The following states are defined for Copley Controls CANopen amplifiers:

State	Description
Pre-operational	Every node enters this state after power-up or reset. In this state, the device is not functional, but will communicate over the CANopen network. PDO transfers are not allowed in pre-operational state, but SDO transfers may be used.
Operational	This is the normal operating state for all devices. SDO and PDO transfers are both allowed.
Stopped	No communication is allowed in this state except for network management messages. Neither SDO nor PDO transfers may be used.

State Control Messages

One use of NMT messages is to control state changes on network devices. The following NMT messages are sent by the network manager to control these state changes. Each of these messages can be either sent to a single node (by node ID), or broadcast to all nodes.

Message	Effect
Reset	Causes each receiving node to perform a soft reset and come up in pre-operational state.
Reset communications	Causes each receiving node to reset its CANopen network interface to power-on state, and enter pre-operational state. This is not a full device reset, just a reset of the CANopen interface.
Pre-operational	Causes the receiving node(s) to enter pre-operational state. No reset is performed.
Start	Causes the node(s) to enter operational state.
Stop	Causes the node(s) to enter stopped state.

Device Monitoring

Monitoring Protocols

In addition to controlling state machines, NMT messages provide services for monitoring devices on the network. Monitoring services use one of two protocols: heartbeat and node guarding.

Heartbeat Protocol

The heartbeat protocol allows the network manager application to detect problems with a device or its network connection. The CANopen master configures the device to periodically transmit a heartbeat message indicating the device's current state (pre-operational, operational, or stopped). The network manager monitors the heartbeat messages. Failure to receive a node's heartbeat messages indicates a problem with the device or its connection to the network.

Node-guarding Protocol

The node-guarding protocol is similar to the heartbeat, but it allows both the device and the network manager to monitor the connection between them. The network manager configures the device (node) to expect node-guarding messages at some interval. The network manager then sends a message to the configured device at that frequency, and the device responds with a node-guarding message. This allows both the network manager and the device to identify a network failure if the guarding messages stop.

SYNC and High-resolution Time Stamp Messages

The SYNC message is a standard CANopen message used to synchronize multiple devices and to trigger the synchronous transmission of PDOs.

In addition, to allow more accurate synchronization of device clocks, Copley Controls CANopen amplifiers use the optional high-resolution time stamp message specified in the Communication Profile.

Normally, a single device produces both the SYNC message and the high-resolution time stamp message. Copley amplifiers can produce the SYNC and high-resolution time stamp messages.

We recommend using an amplifier as the master sync generator. This assures greater timing accuracy and allows the amplifier PVT segment buffer to be filled with the minimum number of PVT segments at all times during operation.

Time Stamp PDOs

The device designated as the time stamp producer should have a transmit PDO mapped for the high-resolution time stamp message. This PDO should be configured for synchronous transmission, based on the SYNC message. We recommend sending this message approximately every 100 milliseconds.

Every other device (all time stamp consumers) should have a receive PDO mapped for the high-resolution time stamp message. The message ID of each receive PDO used to receive a time stamp should match the ID of the transmit PDO used to send the time stamp.

Configuring the devices in this fashion causes the time stamp producer to generate a transmit PDO for every N sync messages. This PDO is received by each of the time stamp consumers on the network and causes them to update their internal system times based on the message content. The result is that all devices on the network act as though they share the same clock input, and remain tightly synchronized.

Emergency Messages

A device sends an 8-byte emergency message (EMCY) when an error occurs in the device. It contains information about the error type, and Copley-specific information. A device need only send one EMCY message per event. Any device can be configured to accept EMCY messages.

EMCY Message Structure

The EMCY message is structured as follows:

Bytes	Description
0, 1	Standard CANopen emergency error code for errors active on the amplifier. See EMCY Message Error Codes , p. 43.
2	Error register object value See Error Register , p. 67.
3	Reserved for future use (0 for now).
4, 5	Bit mask representing the Copley Controls codes for active error conditions on the amplifier (see EMCY Message Copley-Specific Error Conditions , p. 44).
6, 7	Reserved for future use (0 for now).

EMCY Message Error Codes

Bytes 0 and 1 of the EMCY message describe the standard CANopen error codes used by Copley Amplifiers:

Error Code (hex)	Description
2280	Encoder Feedback Error
2310	Current Limited
2320	Short Circuit
3110	Mains Over Voltage
3120	Mains Under Voltage
3310	Output Voltage Limited
4210	Amplifier Over Temperature
4300	Motor Temperature Sensor
5080	Amplifier error
7122	Phasing Error
7380	Positive Limit Switch
7381	Negative Limit Switch
7390	Tracking Error
73A0	Position Wrapped Around +/- 2^{31} Counts
8130	Node Guarding Error or Heartbeat Error

EMCY Message Copley-Specific Error Conditions

The bit mask in bytes 4 and 5 of the EMCY message maps 1 bit for each error condition active on the amplifier. The mapped bits have the following meanings:

Bit	Description
0	Output short circuit
1	Amplifier over temperature
2	Amplifier over voltage
3	Amplifier under voltage
4	Motor over temperature input active
5	Encoder power error (indicates the 5V encoder supply over current)
6	Motor phasing error
7	Output current limited
8	Output voltage limited
9	Positive limit switch
10	Negative limit switch
11	Tracking error
12	Position input wrapped around $\pm 2^{31}$ bits
13	Amplifier internal hardware error (contact Copley Controls customer support)
14	Node guarding error

2.2: Network Management Objects

Contents of this Section

This section describes closely related to network management. They include:

COB-ID Sync Message Index 0x1005	46
Communication Cycle Period Index 0x1006	46
Guard Time Index 0x100C.....	46
Life Time Factor Index 0x100D.....	47
High-resolution Time Stamp Index 0x1013.....	47
Producer Heartbeat Time Index 0x1017	47
Emergency Object ID Index 0x1014	47
Emergency Object ID Inhibit Time Index 0x1015.....	47
Network Options Index 0x21B	48
Abort Option Code Index 0x6007	48
Serial Port Command Send Index 0x2000.....	48

COB-ID SYNC MESSAGE**INDEX 0x1005**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See SYNC ID Format , below.	NO	R

Description

This object defines the CAN object ID (COB-ID) associated with the SYNC message. The SYNC message is a standard CANopen message type used to synchronize multiple devices on a CANopen network.

SYNC ID Format

The SYNC message ID is formatted as follows:

Bits	Description
0-10	Give the 11-bit identifier for standard (CAN 2.0A) identifiers, or the lower 11 bits for extended (CAN 2.0B) identifiers.
11-28	Give the upper 18 bits of extended identifiers. For standard identifiers these bits should be written as zeros.
29	Identifier format. This bit is clear for standard (11-bit) identifiers, and set for extended (29-bit) identifiers.
30	If set, the amplifier is configured as the SYNC message producer. This bit should be set in at most one amplifier on a network.
31	Reserved

COMMUNICATION CYCLE PERIOD**INDEX 0x1006**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	microseconds	-	NO	R

Description

This object defines the interval between SYNC messages in units of microseconds.

An amplifier configured as a SYNC message producer will not produce SYNC messages unless this object contains a non-zero value. A value of zero in this object disables SYNC message production.

Amplifiers not configured to produce SYNC messages ignore the value of this object.

GUARD TIME**INDEX 0x100C**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	-	NO	R

Description

This object gives the time between node-guarding requests that are sent from the network master to this amplifier. The amplifier will respond to each request with a node-guarding message indicating the internal state of the amplifier.

If the amplifier has not received a node-guarding request within the time period defined by the product of the guard time and the [Life Time Factor](#) (index [0x100D](#), p. 47), the amplifier will treat this lack of communication as a fault condition.

LIFE TIME FACTOR**INDEX 0x100D**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	-	NO	R

Description

This object gives a multiple of the [GUARD Time](#) (index [0x100C](#), p. 46). The amplifier expects to receive a node-guarding request within the time period defined by the product of the guard time and the lifetime factor. If the amplifier has not received a node-guarding request within this time period, it treats this condition as a fault.

HIGH-RESOLUTION TIME STAMP**INDEX 0x1013**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	microseconds	0 - 294,967,295	YES	R

Description

This object holds a time stamp indicating the amplifier's internal time (in microseconds) when the last SYNC message was received (or transmitted for the SYNC producer). Writing to this object will cause the amplifier to adjust its internal clocks to reconcile the difference between the value passed and the internal value of the time stamp.

The purpose of this object is to allow multiple amplifiers to synchronize their clocks across the CANopen network. To enable this feature, one amplifier should be selected as a high-resolution time stamp producer. This amplifier should have a transmit PDO configured to transmit this object to the rest of the network at a rate of approximately 10 Hertz (once every 100 milliseconds).

Every other amplifier should have a receive PDO configured (using the same COB-ID as the producer's transmit PDO) to update its time stamp using the value passed by the producer.

PRODUCER HEARTBEAT TIME**INDEX 0x1017**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	-	NO	R

Description

This object gives the frequency at which the amplifier will produce heartbeat messages. This object may be set to zero to disable heartbeat production. Note that only one of the two node-guarding methods may be used at once. If this object is non-zero, then the heartbeat protocol is used regardless of the settings of the node-guarding time and lifetime factor.

EMERGENCY OBJECT ID**INDEX 0x1014**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	R

Description

CAN message ID used with the emergency object. See [Emergency Messages](#), p. 42 and the *CANopen Application Layer and Communication Profile (DS 301)*.

EMERGENCY OBJECT ID INHIBIT TIME**INDEX 0x1015**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	-	NO	R

Description

Inhibit time for the emergency object. See [Emergency Messages](#), p. 40 and the *CANopen Application Layer and Communication Profile (DS 301)*.

NETWORK OPTIONS**INDEX 0x21B**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	NO	RF

Description

Network options. Configures the amplifier's network.

CANopen

Bits	Meaning
0	Must be clear to select CANopen networking.
1-15	Reserved

ABORT OPTION CODE**INDEX 0x6007**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	microseconds	-	RW	RF

Description

Abort option code for CANopen / EtherCAT drives.

SERIAL PORT COMMAND SEND**INDEX 0x2000**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	-	-	No	RF

Description

Used to send serial port commands over a CANopen/EtherCAT bus. See section [2.3: Sending Serial Commands over CANopen](#) (p. 49).

2.3: Sending Serial Commands over CANopen

Contents of this Section

This section describes how serial commands over a CANopen network are sent to and retrieved from an amplifier. Topics include:

Overview.....	50
Byte order	50

Overview

CANopen object 0x2000 (sub-index 0) is used to send serial commands and retrieve the response from the amplifier. Each serial command consists of two parts, a command message sent to the amplifier, and a response message retrieved from it.

Sending a command to the amplifier is done by writing to CANopen object 0x2000. The first byte sent is the command code of the serial command to be executed. This is followed by any data bytes that are required for the command. Then, the response from the amplifier is retrieved by reading from object 0x2000. The first byte received will be an error code (same error codes as used in the serial interface). This is followed by zero or more bytes of response data.

For example:

To read actual position, the following bytes would be written to object 0x2000 using an SDO transfer:

0x0C 0x17 0x00

The first byte (0x0C) is the command code for a GET command. The second and third bytes (0x17 0x00) make up the one word of data passed to a GET command. This data word (0x0017) is the variable ID that is to be read (in this case, variable 0x17, which is the actual position). The response is read from an SDO reading back the value of object 0x2000.

For example:

If the following data bytes were read from 0x2000:

0x00 0x34 0x12 0x78 0x56

The first byte gives an error code. A zero here indicates no error. The next four bytes are the position read back from the amplifier. In this case, the position read back is 0x12345678.

Byte order

The byte order of data sent to or from the amplifier requires some further explanation.

The amplifier (serial port interface) works internally with 16-bit words of data. All serial commands take zero or more words of data and return zero or more words. When 32-bit values are passed to or from the amplifier, they are always sent most significant word first. When this array of 16-bit words of data is sent over the CANopen interface, each word of data is split into two bytes.

CANopen always sends data least significant byte first. Therefore, when a 32-bit value is sent over the CANopen interface, it's first split into two 16-bit words (most significant word followed by least significant word). Then, each word is split into two bytes using the CANopen standard of least significant byte followed by most significant.

For example:

The 32-bit value 0x12345678 would first be split into the words 0x1234 0x5678. These two words would then be split into the bytes 0x34 0x12 0x78 0x56.

Any serial command that is processed by the main amplifier firmware (as opposed to the boot loader) can be sent over the CANopen interface using this method. Any command that needs to be sent to the boot loader (such as a firmware upload) cannot be sent using this method.

CHAPTER

3: DEVICE CONTROL, CONFIGURATION, AND STATUS

This chapter describes a wide range of device control, configuration, and status methods and objects.

Contents include:

3.1: Device Control and Status Overview	52
3.2: Device Control and Status Objects	57
3.3: Error Management Objects	66
3.4: Basic Amplifier Configuration Objects	70
3.5: Basic Motor Configuration Objects	89
3.6: Real-time Amplifier and Motor Status Objects	110

3.1: Device Control and Status Overview

Contents of this Section

This section describes the objects and functions used to control the status of an amplifier.

Topics include:

Control Word, Status Word, and Device Control Function	53
State Changes Diagram.....	55

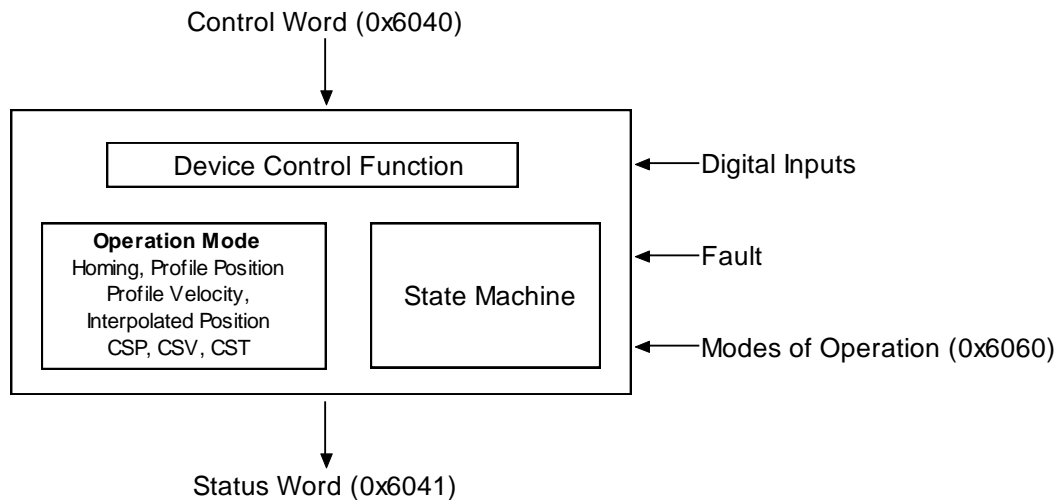

Control Word, Status Word, and Device Control Function

Device Control Function Block

The *CANopen Profile for Drives and Motion Control (DSP 402)* describes control of the amplifier in terms of a control function block with two major sub-elements: the operation modes and the state machine.

Control and Status Words

As illustrated below, the [Control Word](#) object (index [0x6040](#), p. [58](#)) manages device mode and state changes. The [Status Word](#) object (index [0x6041](#), p. [58](#)) identifies the current state of the amplifier. The [Mode Of Operation](#) object (index [0x6060](#), p. [64](#)) sets the amplifier's operating mode.

Other factors affecting control functions include: digital input signals, fault conditions, and settings in various dictionary objects.

Operation Modes

As controlled by the [Mode Of Operation](#) object (index [0x6060](#), p. [64](#)), Copley Controls CANopen amplifiers support homing, profile position, profile velocity, profile torque, and interpolated position modes.

State Machine Nesting

Note that the Communication Profile also specifies a state machine, with three states: pre-operational, operational, and stopped. The entire device control function block described in this chapter, including the device state machine, operates in the operational state of the Communication Profile state machine.

State Machine and States

The state machine describes the status and possible control sequences of the drive. The state also determines which commands are accepted.

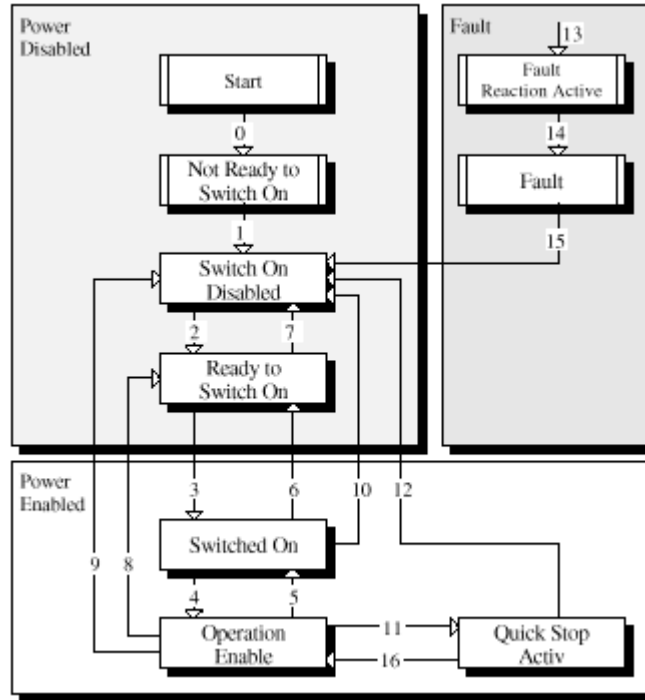

States are described below:

State	Description
Not Ready to Switch On	Low-level power (e.g. $\pm 15V$, 5V) has been applied to the drive. The drive is being initialized or is running self-test. A brake, if present, is applied in this state. The drive function is disabled.
Switch On Disabled	Drive initialization is complete. The drive parameters have been set up. Drive parameters may be changed. The drive function is disabled.
Ready to Switch On	The drive parameters may be changed. The drive function is disabled.
Switched On	High voltage has been applied to the drive. The power amplifier is ready. The drive parameters may be changed. The drive function is disabled.
Operation Enable	No faults have been detected. The drive function is enabled and power is applied to the motor. The drive parameters may be changed. (This corresponds to normal operation of the drive.)
Quick Stop Active	The drive parameters may be changed. The quick stop function is being executed. The drive function is enabled and power is applied to the motor. If the 'Quick-Stop-Option-Code' is switched to 5 (Stay in Quick-Stop), the amplifier cannot exit the Quick-Stop-State, but can be transmitted to 'Operation Enable' with the command 'Enable Operation.'
Fault Reaction Active	The drive parameters may be changed. A non-fatal fault has occurred in the drive. The quick stop function is being executed. The drive function is enabled and power is applied to the motor.
Fault	The drive parameters may be changed. A fault has occurred in the drive. The drive function is disabled.

State Changes Diagram

Diagram

The following diagram from the *CANopen Profile for Drives and Motion Control (DSP 402)* shows the possible state change sequences of an amplifier. Each transition is numbered and described in the legend below.

State Changes Diagram Legend

	From State	To State	Event/Action
0	Startup	Not Ready to Switch On	Event: Reset. Action: The drive self-tests and/or self-initializes.
1	Not Ready to Switch On	Switch On Disabled	Event: The drive has self-tested and/or initialized successfully. Action: Activate communication and process data monitoring
2	Switch On Disabled	Ready to Switch On	Event: 'Shutdown' command received from host. Action: None
3	Ready to Switch On	Switched On	Event: 'Switch On' command received from host. Action: The power section is switched on if it is not already switched on.
4	Switched On	Operation Enable	Event: 'Enable Operation' command received from host. Action: The drive function is enabled.
5	Operation Enable	Switched On	Event: 'Disable Operation' command received from host. Action: The drive operation is disabled.
6	Switched On	Ready to Switch On	Event: 'Shutdown' command received from host. Action: The power section is switched off.
7	Ready to Switch On	Switch On Disabled	Event: 'Quick stop' command received from host. Action: None
8	Operation Enable	Ready to Switch On	Event: 'Shutdown' command received from host. Action: The power section is switched off immediately, and the motor is free to rotate if unbraked
Continued....			

...State Changes Diagram Legend, continued:

	From State	To State	Event/Action
9	Operation Enable	Switch On Disabled	Event: 'Disable Voltage' command received from host. Action: The power section is switched off immediately, and the motor is free to rotate if unbraked
10	Switched On	Switch On Disabled	Event: 'Disable Voltage' or 'Quick Stop' command received from host. Action: The power section is switched off immediately, and the motor is free to rotate if unbraked
11	Operation Enable	Quick Stop Active	Event: 'Quick Stop' command received from host. Action: The Quick Stop function is executed.
12	Quick Stop Active	Switch On Disabled	Event: 'Quick Stop' is completed or 'Disable Voltage' command received from host. This transition is possible if the Quick-Stop-Option-Code is not 5 (Stay in Quick-Stop) Action: The power section is switched off.
13	FAULT	Fault Reaction Active	A fatal fault has occurred in the drive. Action: Execute appropriate fault reaction.
14	Fault Reaction Active	Fault	Event: The fault reaction is completed. Action: The drive function is disabled. The power section may be switched off.
15	Fault	Switch On Disabled	Event: 'Fault Reset' command received from host. Action: A reset of the fault condition is carried out if no fault exists currently on the drive. After leaving the 'Fault' state the Bit 'Fault Reset' of the Control Word has to be cleared by the host.
16	Quick Stop Active	Operation Enable	Event: 'Enable Operation' command received from host. This transition is possible if the Quick-Stop-Option-Code is 5, 6, 7, or 8 (see the Quick Stop Option Code object, index 0x6085 , p. 63). Action: The drive function is enabled.

3.2: Device Control and Status Objects

Contents of this Section

This section describes the objects used to control the status of an amplifier.

They include:

Control Word Index: 0x6040	58
Status Word Index 0x6041	58
Manufacturer Status Register Index 0x1002.....	60
Network Status Word Index 0x21B4.....	61

Desired State Index 0x2300.....	65

CONTROL WORD**INDEX: 0x6040**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	EVENT	R

Description

This object is used to controls the state of the amplifier. It can be used to enable / disable the amplifier output, start, and abort moves in all operating modes, and clear fault conditions.

Control Word Bit Mapping

The value programmed into this object is bit-mapped as follows:

Bits	Description
0	Switch On. This bit must be set to enable the amplifier.
1	Enable Voltage. This bit must be set to enable the amplifier.
2	Quick Stop. If this bit is clear, then the amplifier is commanded to perform a quick stop.
3	Enable Operation. This bit must be set to enable the amplifier.
4-6	Operation mode specific. Descriptions appear in the sections that describe the various operating modes. Also see Mode Of Operation (index 0x6060, p. 64).
7	Reset Fault. A low-to-high transition of this bit makes the amplifier attempt to clear any latched fault condition.
8	Halt. If the bit is set, the amplifier will perform a halt.
9-15	Reserved for future use.

STATUS WORD**INDEX 0x6041**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	See <i>Description</i> , below.	Event	-

Description

This object identifies the current state of the amplifier and is bit-mapped as follows:

Bits	Description
0	Ready to switch on.
1	Switched on.
2	Operation Enabled. Set when the amplifier is enabled.
3	Fault. If set, a latched fault condition is present in the amplifier.
4	Voltage enabled. Set if the amplifier bus voltage is above the minimum necessary for normal operation.
5	Quick Stop. When clear, the amplifier is performing a quick stop.
6	Switch on disabled.
7	Warning. Set if a warning condition is present on the amplifier. Read the Manufacturer Status Register object (index 0x1002, p. 60) for details of what warning is bit indicates.
8	Set if the last trajectory was aborted rather than finishing normally.
9	Remote. Set when the amplifier is being controlled by the CANopen interface. When clear, the amplifier may be monitored through this interface, but some other input source is controlling it. Other input sources include the serial port, amplifier CVM program, analog reference input, digital command signals (i.e. PWM input or master controller), and internal function generator. The input source is controlled by the 'amplifier desired state' value, which is normally programmed by the CME-2 software. This setting can be manipulated through the CANopen interface through the Desired State object (index 0x2300, p. 65).
10	Target Reached. This bit is set when the amplifier is finished running a trajectory, and the Position Error (index 0x60F4, p. 138) has been within the Position Tracking Window (index 0x6067, p. 137) for the programmed time. The bit is not cleared until a new trajectory is started.
11	Internal Limit Active. This bit is set when one of the amplifier limits (current, voltage, velocity or position) is active. The specific bits from the Manufacturer Status Register (index 0x1002, p. 60) that cause this bit to be set can be customized by using the mask defined in the Limit Status Mask object (index 0x2184, p. 62).

Continued...

...continued:						
12-13	The meanings of these bits are operation mode specific:					
	Bit	Profile Position Mode	Profile Velocity Mode	Profile Torque Mode	Homing Mode	Interpolated Position Mode
	12	Setpoint acknowledge.	Speed = 0.	Reserved	Homing attained.	Interpolated pos. mode active.
	13	Following error.	Maximum slippage error.	Reserved.	Homing error.	Reserved.
	For information on operation modes, see Mode Of Operation (index 0x6060 , p. 64).					
14	Set when the amplifier is performing a move and cleared when the trajectory finishes. This bit is cleared immediately at the end of the move, not after the motor has settled into position.					
15	Reserved.					

MANUFACTURER STATUS REGISTER**INDEX 0x1002**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	See <i>Description</i> , below.	EVENT	-

Description

This 32-bit object is a bit-mapped status register with the following fields:

Bit	Description
0	Short circuit detected
1	Amplifier over temperature
2	Over voltage
3	Under voltage
4	Motor temperature sensor active
5	Feedback error
6	Motor phasing error
7	Current output limited
8	Voltage output limited
9	Positive limit switch active
10	Negative limit switch active
11	Enable input not active
12	Amp is disabled by software
13	Trying to stop motor
14	Motor brake activated
15	PWM outputs disabled
16	Positive software limit condition
17	Negative software limit condition
18	Tracking error
19	Tracking warning
20	Amplifier is currently in a reset condition
21	Position has wrapped. The Position variable cannot increase indefinitely. After reaching a certain value the variable rolls back. This type of counting is called position wrapping or modulo count.
22	Amplifier fault. See the fault latch for more info.
23	Velocity limit has been reached.
24	Acceleration limit has been reached.
25	Position Error (index 0x60F4, p. 138) is outside Position Tracking Window (index 0x6067, p. 137).
26	Home switch is active.
27	In motion. This bit is set when the amplifier is finished running a trajectory, and the Position Error (index 0x60F4, p. 138) has been within the Position Tracking Window (index 0x6067, p. 137) for the programmed time. The bit is not cleared until a new trajectory is started.
28	Velocity window. Set if the absolute velocity error exceeds the velocity window value.
29	Phase not yet initialized. If the amplifier is phasing with no Halls, this bit is set until the amplifier has initialized its phase.
30	Command fault. PWM or other command signal not present. . If Allow 100% Output option is enabled, by a setting Bit 3 of Digital Input Command Configuration (Object 0x2320, p. 121), this fault will not detect a missing PWM command.

NETWORK STATUS WORD**INDEX 0x21B4**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	EVENT	-

Description

Network status word. Bit mapped as follows:

CANopen											
Bits	Meaning										
0-1	CANopen node status. This field will take one of the following values:										
	<table> <tr> <th>Value</th><th>Status</th></tr> <tr> <td>0</td><td>The CANopen interface is disabled.</td></tr> <tr> <td>1</td><td>Stopped mode.</td></tr> <tr> <td>2</td><td>Preoperational mode.</td></tr> <tr> <td>3</td><td>Operational mode.</td></tr> </table>	Value	Status	0	The CANopen interface is disabled.	1	Stopped mode.	2	Preoperational mode.	3	Operational mode.
Value	Status										
0	The CANopen interface is disabled.										
1	Stopped mode.										
2	Preoperational mode.										
3	Operational mode.										
4	Set if the CANopen SYNC message is missing.										
5	Set on a CANopen guard error.										
8	Set if the CAN port is in 'bus off' state.										
9	Set if the CAN port is in 'transmit error passive' state.										
10	Set if the CAN port is in 'receive error passive' state.										
11	Set if the CAN port is in 'transmit warning' state.										
12	Set if the CAN port is in 'receive warning' state.										
DeviceNet											
Bit	Meaning										
0	Set if duplicate MAC ID check failed.										
1	Set if device is online.										
2	Set if at least one communication object timed out.										
3	Set if at least one communication object has been established.										
4-7	Reserved.										
8-14	Same bit mapping as for CANopen.										
15	Always set for DeviceNet.										
MACRO											
Bit	Meaning										
0	Set if the MACRO network is detected,										
1	Set if the amplifier is being disabled by the MACRO master.										
2	Set if the MACRO network has been broken (i.e. once detected but now gone).										
3	Set on heartbeat error.										
4-15	Reserved.										
EtherCAT											
Bit	Meaning										
0	Set if distributed clock is enabled (SYNC0 enabled and period set to a legal value).										
1	Set if distributed clock is locked.										
2	If the distributed clock is locked, this bit identifies whether it is locked to the current loop period (0), or position loop period (1).										
3-15	Reserved										

'STICKY' EVENT STATUS REGISTER**INDEX 0x2180**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	YES	-

Description

Sticky Amplifier Event Status Register. This read-only parameter is bit-mapped in exactly the same way as the [Manufacturer Status Register](#) (index 0x1002, p. 60), but instead of giving the present status of the amplifier, the sticky version indicates any bits in the [Manufacturer Status Register](#) that have been set since the last reading of the sticky register.

The sticky register is similar to the [Latched Event Status Register](#) (index 0x2181, p. 62), but the latched register must be cleared explicitly, whereas the sticky register is cleared automatically each time it is read.

LATCHED EVENT STATUS REGISTER**INDEX 0x2181**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RC	-	-	YES	R

Description

This is a latched version of the [Manufacturer Status Register](#) object (index 0x1002, p. 60). Bits are set by the amplifier when events occur. Bits are cleared only by a set command.

When writing to the Latched Event Status Register, any bit set in the written value will cause the corresponding bit in the register to be cleared. For example, writing the value 0x0010020C would clear bits 2, 3, 9, and 20. To clear the short circuit detected bit, write a 1 to the register. To clear all bits, write 0xFFFFFFFF to the register.

LIMIT STATUS MASK**INDEX 0x2184**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	YES	RF

Description

This parameter defines which bits in the [Manufacturer Status Register](#) object (index 0x1002, p. 60) can set the limit bit (bit 11) of the [Status Word](#) object (index 0x6041, p. 58). If a [Manufacturer Status Register](#) bit and its corresponding Limit Mask bit are both set, then the CANopen Status Word limit bit is set. If all selected a [Manufacturer Status Register](#) bits are clear, then the limit bit is clear.

QUICK STOP OPTION CODE**INDEX 0x605A**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	R

Description

This object defines the behavior of the amplifier when a quick stop command is issued. The following values are defined.

Value	Description
0	Disable the amplifier's outputs
1	Slow down using the normal slow down ramp programmed in Profile Deceleration (index 0x6084, p. 203). When the move has been successfully aborted the amplifier's state will transition to the 'switch on disabled' state.
2	Slow down using the quick stop ramp programmed in Quick Stop Deceleration (index 0x6085, p. 204) then transition to 'switch on disabled'.
3	Stop the move abruptly and transition to 'switch on disabled'.
5	Slow down using the slow down ramp. The amplifier state will remain in the 'quick stop' state after the move has been finished.
6	Slow down using the quick stop ramp and stay in 'quick stop' state.
7	Stop the move abruptly and stay in 'quick stop' state.

All other values will produce unspecified results and should not be used.

SHUTDOWN OPTION CODE**INDEX 0x605B**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	R

Description

This object defines the behavior of the amplifier when the amplifier's state is changed from “operation enabled” to “ready to switch on.” The following values are defined:

Value	Description
0	Disable the amplifier's outputs.
1	Slow down using the slow down ramp (i.e. the normal move deceleration value).

All other values will produce unspecified results and should not be used.

DISABLE OPERATION OPTION CODE**INDEX 0x605C**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	R

Description

This object defines the behavior of the amplifier when the amplifier's state is changed from “operation enabled” to “switched on.” The following values are defined.

Value	Description
0	Disable the amplifier's outputs.
1	Slow down using the slow down ramp (i.e. the normal move deceleration value).

All other values will produce unspecified results and should not be used.

HALT OPTION CODE**INDEX 0x605D**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	R

Description

This object defines the behavior of the amplifier when a halt command is issued. The following values are defined.

Value	Description
0	Disable the amplifier's outputs.
1	Slow down using the slow down ramp (i.e. the normal move deceleration value).
2	Slow down using the quick stop ramp.
3	Stop the move abruptly.

All other values will produce unspecified results and should not be used.

MODE OF OPERATION**INDEX 0x6060**

Type	Access	Units	Range	Map PDO	Memory
Integer 8	RW	-	See <i>Description</i> , below.	YES	R

Description

This object selects the amplifier's mode of operation. The modes of operation presently supported by this device are:

Mode	Description
1	Profile Position mode.
3	Profile Velocity mode.
4	Profile Torque mode.
6	Homing mode.
7	Interpolated Position mode.
8	Cyclic Synchronous Position mode.
9	Cyclic Synchronous Velocity mode.
10	Cyclic Synchronous Torque mode.

The amplifier will not accept other values.

Note that there may be some delay between setting the mode of operation and the amplifier assuming that mode. To read the active mode of operation, use object 0x6061.

MODE OF OPERATION DISPLAY**INDEX 0x6061**

Type	Access	Units	Range	Map PDO	Memory
Integer 8	RO	-	See <i>Description</i> , below.	EVENT	-

Description

This object displays the current mode of operation. See [Mode Of Operation](#) (index 0x6060, p. 64).

POSITION OFFSET IN CST MODE**INDEX 0x60B0**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	-	User defined units	YES	-

Description

This object provides the offset for a target position.

VELOCITY OFFSET IN CSV MODE**INDEX 0x60B1**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	-	User defined units	YES	-

Description

This object provides the offset for a target velocity. For more information see section (p. [Error! Bookmark not defined.](#)).

VELOCITY OFFSET IN CSV MODE**INDEX 0x60B2**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	-	User defined units	YES	-

Description

This object provides the offset for a target torque. For more information see section (p. [Error! Bookmark not defined.](#)).

DESIRED STATE**INDEX 0x2300**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	RF

Description

This object defines what input source controls the amplifier, and what general mode the amplifier runs in. It is encoded as follows:

Code	Description
0	Disabled.
1	The current loop is driven by the programmed current value.
2	The current loop is driven by the analog command input.
3	The current loop is driven by the PWM & direction input pins.
4	The current loop is driven by the internal function generator.
5	The current loop is driven by UV commands via PWM inputs.
11	The velocity loop is driven by the programmed velocity value.
12	The velocity loop is driven by the analog command input.
13	The velocity loop is driven by the PWM & direction input pins.
14	The velocity loop is driven by the internal function generator.
21	In servo mode, the position loop is driven by the trajectory generator.
22	In servo mode, the position loop is driven by the analog command input.
23	In servo mode, the position loop is driven by the digital inputs (pulse & direction, master encoder, etc).
24	In servo mode, the position loop is driven by the internal function generator.
25	In servo mode, the position loop is driven by the camming function.
30	In servo mode, the position loop is driven by the CANopen interface.
31	In microstepping mode, the position loop is driven by the trajectory generator.
33	In microstepping mode, the position loop is driven by the digital inputs (pulse & direction, master encoder, etc).
34	In microstepping mode, the position loop is driven by the internal function generator.
35	In microstepping mode, the position loop is driven by the camming function.
40	In microstepping mode, the amplifier is driven by the CANopen interface.
42	Micro-stepping diagnostic mode. The current loop is driven by the programmed current value, and the phase angle is micro-stepped.
Unlisted codes are reserved.	

Note that this object should normally be programmed to 30 (or 40 for stepper motors) for use under the CANopen interface.

3.3: Error Management Objects

Contents of this Section

This section describes objects used to view error status and define error limits and error handling. They include:

Pre-Defined Error Object	Index 0x1003	67
Number of Errors	Index 0x1003, Sub-Index 0.....	67
Standard Error Field	Index 0x1003, Sub-Index 1-8.....	67
Error Register	Index 0x1001	67
Tracking Error Window	Index 0x2120	67
Fault Mask	Index 0x2182.....	68
Latching Fault Status Register	Index 0x2183.....	69
Status of Safety Circuit	Index 0x219D.....	69
Heartbeat Error Action	Index 0x21B2.....	69

PRE-DEFINED ERROR OBJECT**INDEX 0x1003**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	-	NO	R

Description

This object provides an error history. Each sub-index object holds an error that has occurred on the device and has been signaled via the Emergency Object. See [Emergency Messages](#) (p. 42). The entry at sub-index 0 contains the number of errors that are recorded in the array starting at sub-index 1. Each new error is stored at sub-index 1. Older errors move down the list.

NUMBER OF ERRORS**INDEX 0x1003, SUB-INDEX 0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	-	0-8	NO	R

Number of errors in the error history (number of sub-index objects 1-8). Writing a 0 deletes the error history (empties the array). Writing a value higher than 0 results in an error.

STANDARD ERROR FIELD**INDEX 0x1003, SUB-INDEX 1-8**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	R

Description

One sub-index object for each error found, up to 8 errors. Each is composed of a 16-bit error code and a 16-bit additional error information field. The error code is contained in the lower 2 bytes (LSB) and the additional information is included in the upper 2 bytes (MSB).

ERROR REGISTER**INDEX 0x1001**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RO	-	See <i>Description</i> , below.	YES	-

Description

This object is a bit-mapped list of error conditions present in the amplifier. The bits used in this register are mapped as follows:

Bits	Description
0	Generic error. This bit is set any time there is an error condition in the amplifier.
1	Current error. Indicates either a short circuit on the motor outputs, or excessive current draw by the encoder.
2	Voltage error. The DC bus voltage supplied to the amplifier is either over or under the amplifier's limits.
3	Temperature error. Either the amplifier or motor is over temperature. Note that the amplifier will only detect a motor over temperature condition if an amplifier input has been configured to detect this condition.
4	Communication error. The amplifier does not presently use this bit.
5-6	Reserved for future use.
7	The following errors cause this bit to be set; Motor phasing error, tracking error, limit switch active.

TRACKING ERROR WINDOW**INDEX 0x2120**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Counts	0 - 2,147,483,647	YES	RF

Description

Also known as Position Tracking Error Limit. Specifies the maximum absolute [Position Error](#) (index [0x60F4](#), p. 138) allowed before a tracking error event is triggered. If the [Position Error](#) exceeds this value, then the tracking warning bit (bit 18) is set in the [Manufacturer Status Register](#) (index [0x1002](#), p. 60). Using the [Fault Mask](#) object (index [0x2182](#), p. 68), the tracking error event can be configured to either disable the amplifier immediately, or abort the present move and continue holding position.

FAULT MASK**INDEX 0x2182**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below.	YES	RF

Description

This variable is used to configure which amplifier events cause latching faults. Setting a fault mask bit to 1 causes the associated amplifier event to cause a latching fault when it occurs. Setting a fault mask bit to 0 disables fault latching on the associated event.

Latched faults may be cleared using the [Latching Fault Status Register](#) Object (index 0x2183, p. 69).

The fault mask is bit-mapped as follows:

Bits	Contents
0	Data flash CRC failure. This bit is read only and cannot be cleared. It indicates that the amplifier detected corrupted flash data values on startup. The amplifier will remain disabled and indicate a fault condition.
1	Amplifier internal error. This bit is read only and cannot be cleared. It indicates that the amplifier failed its power-on self-test. The amplifier will remain disabled and indicate a fault condition.
2	Short circuit. If set, then the amplifier will latch a fault condition when a short circuit is detected on the motor outputs. If clear, the amplifier will disable its outputs for 100 milliseconds and then re-enable.
3	Amplifier over temperature. If set, this bit will cause an amplifier over temperature condition to act as a latching fault. If clear, the amplifier will re-enable as soon as it cools sufficiently.
4	Motor over temperature. If set, an active input on a motor temperature sensor will cause the amplifier to latch a fault condition. If clear, the amplifier will re-enable as soon as the over temperature input becomes inactive.
5	Over voltage. Determines whether excessive bus voltage will cause a latching fault.
6	Under voltage. Determines whether inadequate bus voltage will cause a latching fault.
7	Feedback fault. Allows encoder power errors to cause latching faults. Feedback faults occur if: a digital encoder draws too much current from the 5-volt source on the amplifier; a resolver or analog encoder is disconnected; a resolver or analog encoder has levels out of tolerance. This is not available for all amps.
8	Phasing error. If set, phasing errors are latched. If clear, the amplifier is re-enabled when the phasing error is removed.
9	Tracking error. If set, a tracking error will cause the amplifier to latch in the disabled state. If clear, a tracking error will cause the present move to be aborted, but the amplifier will remain enabled.
10	Output current limited by I ² T algorithm.
11	FPGA failure. This bit is read only and cannot be cleared. It indicates that the amplifier detected an FPGA failure. The amplifier will remain disabled and indicate a fault condition.
12	Command input lost fault. If set: programs the amplifier to latch in the disabled state when the command input is lost. This fault is currently only available on special amplifiers.
13-31	Reserved

LATCHING FAULT STATUS REGISTER**INDEX 0x2183**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RC	-	-	YES	R

Description

Bit-mapped to show which latching faults have occurred in the amplifier. When a latching fault has occurred, the fault bit (bit 22) of the [Manufacturer Status Register](#) object (index 0x1002, p. 60) is set. The cause of the fault can be read from this register.

To clear a fault condition, write a 1 to the associated bit in this register.

The events that cause the amplifier to latch a fault are programmable. See [Fault Mask](#) object (index 0x2182, p. 68) for details.

Latched Faults	
Bit	Fault Description
0	Data flash CRC failure. This fault is considered fatal and cannot be cleared.
1	Amplifier internal error. This fault is considered fatal and cannot be cleared.
2	Short circuit.
3	Amplifier over temperature.
4	Motor over temperature.
5	Over voltage.
6	Under voltage.
7	Feedback fault.
8	Phasing error.
9	Tracking error.
10	Over Current,
11	FPGA failure.
12	Command input lost.
13	FPGA failure (yes, there are two bits for this, they mean slightly different things)
14	Safety circuit fault.
15	Unable to control current.
16-31	Reserved.

STATUS OF SAFETY CIRCUIT**INDEX 0x219D**

Type	Access	Units	Range	Map PDO	Memory
Integer32		-	-		R

Description

This parameter allows the status of the safety circuit built into some amplifiers to be queried. For amplifiers without a safety circuit, this parameter is reserved.

Bit	Description
0	Set when safety input 0 is preventing the amplifier from enabling.
1	Set when safety input 1 is preventing the amplifier from enabling.
8	This read/write bit can be used to force the 'amplifier is unsafe' output of the safety circuit to go active for testing purposes. Write 1 to force.

HEARTBEAT ERROR ACTION**INDEX 0x21B2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned16	RO	-	-	YES	R

Description

This parameter can be set to stop and hold or disable the drive when a heartbeat error occurs..
0 = stop and hold, 1 = disable drive.

3.4: Basic Amplifier Configuration Objects

Objects described in this section provide access to basic amplifier parameters. They include:

They include:

Device Type	Index 0x1000	72
Device Name	Index 0x1008	72
Hardware Version String	Index 0x1009	72
Store Parameters	Index 0x1010	72
Store All Objects	Index 0x1010, Sub-index 1 or string	72
Store Communication Parameters	Index 0x1010, Sub-index 2	73
Store Device Profile Parameters	Index 0x1010, Sub-index 3	73
Store Manufacturer Specific Parameters	Index 0x1010, Sub-Index 4	73
Software Version Number	Index 0x100A	73
Identity Object	Index 0x1018	73
Vendor ID	Index 0x1018, Sub-index 1	74
Product Code	Index 0x1018, Sub-index 2	74
Revision Number	Index 0x1018, Sub-Index 3	75
Serial Number	Index 0x1018, Sub-Index 4	75
Amplifier Scaling Configuration	Index 0x2080	75
Amplifier Name	Index 0x21A0	76
Misc Amplifier Options Register	Index 0x2420	76
CANopen Network Configuration	Index 0x21B0	77
Input Mapping for CAN Node ID	Index 0x21B1	78
CAN ID Selection Switch Value	Index 0x2197	78

Running Sum of Amp Current Limit Index 0x2117	88
D/A Converter Configuration. Index 0x21E0	88
D/A Converter Output Value Index 0x21E1	88

DEVICE TYPE**INDEX 0x1000**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	See <i>Description</i> , below.	NO	-

Description

Describes the type of device and its functionality.

This 32-bit value is composed of two 16-bit components. The lower two bytes identify the device profile supported by the device. This amplifier supports the DSP402 device profile, indicated by the value 0x0192.

The upper two bytes give detailed information about the type of motors the drive can control. The bit mapping of this value is defined by the *CANopen Profile for Drives and Motion Control (DSP 402)*. For Copley Controls CANopen amplifiers, this value is 0x0006, indicating that Copley Controls supports servo and stepper devices.

DEVICE NAME**INDEX 0x1008**

Type	Access	Units	Range	Map PDO	Memory
String	RO	-	-	NO	-

Description

An ASCII string which gives the amplifier's model number.

HARDWARE VERSION STRING**INDEX 0x1009**

Type	Access	Units	Range	Map PDO	Memory
String	RO	-	-	NO	-

Description

Describes amplifier hardware version.

STORE PARAMETERS**INDEX 0x1010**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	R

Description

Allows the current values programmed into the amplifier's objects to be saved to flash memory. The various sub-index values of this object allow either all objects, or specific groups of objects to be saved. Sub-index 0 contains the number of sub-elements of this record.

STORE ALL OBJECTS**INDEX 0x1010, SUB-INDEX 1 OR STRING**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	R

Description

When read, this object will return the value 1 indicating that the device is able to save objects in this category.

When the ASCII string "save" (or, the corresponding 32-bit value 0x65766173) is written to this object, all objects in the object dictionary that can be saved to flash are written. Objects written to flash will resume the stored value after an amplifier reset.

Note that not every object in the object dictionary may be written to flash. Presently, the objects that define the amplifier's CANopen communication interface are not stored to flash and will resume default values on startup. Most other objects may be stored to flash.

STORE COMMUNICATION PARAMETERS**INDEX 0x1010, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	R

Description

When read, this object returns the value 1, indicating that the device can save objects in this category.

When the ASCII string “save” (or, the corresponding 32-bit value 0x65766173) is written to this object, all objects in the object dictionary that can be saved to flash are written. Objects written to flash resume the stored value after an amplifier reset.

Objects in the category are the objects with indexes in the range 0x1000 – 0x1FFF.

STORE DEVICE PROFILE PARAMETERS**INDEX 0x1010, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	R

Description

When read, this object returns the value 1, indicating that the device can save objects in this category.

When the ASCII string “save” (or, the corresponding 32-bit value 0x65766173) is written to this object, all objects in the object dictionary that can be saved to flash are written. Objects written to flash resume the stored value after an amplifier reset.

Objects in the category are the objects with indexes in the range 0x6000 – 0x9FFF.

STORE MANUFACTURER SPECIFIC PARAMETERS**INDEX 0x1010, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	R

Description

When read, this object returns the value 1 indicating that the device is able to save objects in this category.

When the ASCII string “save” (or, the corresponding 32-bit value 0x65766173) is written to this object, all objects in the object dictionary that can be saved to flash are written. Objects written to flash resume the stored value after an amplifier reset.

Objects in the category are the objects with indexes in the range 0x2000 – 0x5FFF.

SOFTWARE VERSION NUMBER**INDEX 0x100A**

Type	Access	Units	Range	Map PDO	Memory
String	RO	-	-	NO	-

Description

Contains an ASCII string listing the software version number of the amplifier.

IDENTITY OBJECT**INDEX 0x1018**

Type	Access	Units	Range	Map PDO	Memory
Record	RO	-	-	NO	-

Description

This object can uniquely identify an amplifier by unique manufacturer ID, serial number, and product revision information. Sub-index 0 contains the number of sub-elements of this record.

VENDOR ID**INDEX 0x1018, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	0x000000AB	NO	-

Description

A unique identifier assigned to Copley Controls.

The value of this identifier is fixed at: 0x000000AB

PRODUCT CODE**INDEX 0x1018, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	See <i>Description</i> , below.	NO	-

Description

Identifies the specific amplifier model. Also known as Amplifier Hardware Type. Identical to ([Index 0x2384, Sub-Index 13](#), p. 81). The currently defined values for this object are:

Value	Product
0x0000	ASC: Accelus Card.
0x0002	ASP: Accelus Panel.
0x0100	JSP: Junus Panel.
0x0200	ACM: Accelnet Module.
0x0201	XSL: Xenus Panel (obsolete).
0x0203	ACP: Accelnet Panel (obsolete).
0x0206	XSL-R: Xenus Panel, resolver version.
0x0207	XSL: Xenus Panel.
0x0209	ACJ: Accelnet Micro Panel.

REVISION NUMBER**INDEX 0x1018, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	NO	-

Description

Identifies the revision of the CANopen interface.

SERIAL NUMBER**INDEX 0x1018, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	NO	-

Description

The amplifier's serial number. Holds the same value as Amplifier Serial Number ([Index 0x2384, Sub-Index 1, p. 80](#)).

AMPLIFIER SCALING CONFIGURATION**INDEX 0x2080**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	-	-	NO	F

Description

This read-only parameter defines the units used for current and voltage readings from the amplifier:

Bits	Description
0 - 1	Identify units for current readings:
	0 0.01 A
	1 0.001 A
	2 0.0001 A
	3 0.00001 A
2 - 7	Reserved
8 - 9	Identify units for voltage readings:
	0 0.1 V
	1 0.01 V
	2 0.001 V
	3 0.0001 V
10 - 31	Reserved

AMPLIFIER NAME**INDEX 0x21A0**

Type	Access	Units	Range	Map PDO	Memory
String	RW	-	-	NO	F

Description

This object may be used to assign a name to an amplifier. The data written here is stored to flash memory and is not used by the amplifier. Although this object is documented as holding a string (i.e. ASCII data), any values may be written here. Up to 40 bytes are stored.

MISC AMPLIFIER OPTIONS REGISTER**INDEX 0x2420**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	YES	RF

Description

Miscellaneous Amplifier Options Register. Bit-mapped as follows:

Bit	Description
0	If set, input pins 1, 2, and 3 are pulled high on the amplifier. If clear the pins are not pulled up. This option is only available on the Junus amplifier.
1	Reserved.
2	If set, limit switch inputs will only abort a trajectory in progress, but will not affect current output. If clear, limit switches limit current.
3	If set, save PDO configuration to a file in the CVM file system when a "Save to Flash" command is received over the CANopen network. If clear, a PDO is not saved.
4	If set, a limit switch activation will be treated as a fault in the CANopen Status Word (CANopen index 0x6041 as described in the <i>CANopen Programmer's Manual</i>).
5-31	Reserved.

CANOPEN NETWORK CONFIGURATION**INDEX 0x21B0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	RF

Description

This object is used to configure the CANopen network bit rate and node ID for the amplifier.

The bit rate is read only at power-up or reset.

Likewise, the ID is calculated at power-up or reset (and only then) using a combination of general-purpose input pins and a programmed offset value. On certain models, an address switch is also used. The resulting value is clipped to a 7-bit ID in the range 0 to 127.

The configuration parameter is bit-mapped as follows. Values written here are stored to flash memory. The new network configuration will not take effect until the amplifier is reset.

Bit	Description
0-6	Give the node ID offset value.
7	Used only on DeviceNet firmware. If this bit is set, then the drive will be software disabled on startup and will remain disabled until it is enabled by a DeviceNet I/O message with the enable bit set.
8-10	Number of input pins (0-7) to read on startup for the node ID value. If input pins are used (i.e., the value in bits 8-10 is not zero), the inputs can be mapped to node ID bits through the object Input Mapping for CAN Node ID (index 0x21B1, p. 78).
11	<p>This bit is ignored on amplifiers that do not have an address switch.</p> <p>On amplifiers with an address switch, setting this bit programs the amplifier to use the address selector switch as part of the address calculation. In this case, the node ID value is equal to the sum of:</p> <ul style="list-style-type: none"> The value read from the designated input pins, shifted up 4 bits. The address switch value. The programmed offset value. <p>Note that since the node ID is always clipped to the lowest 7 bits, no more than 3 input pins will ever have an effect on the node address when the address switch is used.</p>
12-15	Network bit rate setting.

The network bit rate is encoded as one of the following values:

Code	Bit Rate (bits / second)
0	1,000,000
1	800,000
2	500,000
3	250,000
4	125,000
5	50,000
6	20,000
7-15	Reserved for future use

INPUT MAPPING FOR CAN NODE ID**INDEX 0x21B1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below.	NO	F

Description

When the [CANopen Network Configuration](#) object (index 0x21B0, p. 77) indicates that 1 or more input pins will be used to select the CAN node ID, this mapping register is used to select which input pins will be mapped to which ID bit. Fields include:

Bit	Description
0-3	Identify the general purpose input pin associated with ID bit 0.
4-7	Identify the general purpose input pin associated with ID bit 1.
8-11	Identify the general purpose input pin associated with ID bit 2.
12-15	Identify the general purpose input pin associated with ID bit 3.
16-19	Identify the general purpose input pin associated with ID bit 4.
20-23	Identify the general purpose input pin associated with ID bit 5.
24-27	Identify the general purpose input pin associated with ID bit 6.
28-30	Reserved for future use.
31	Set to enable this register. Clear to use default mapping.

If bit 31 is zero, then a default bit mapping is used and the rest of this register is ignored. The default bit mapping uses the top N input pins and maps them such that the high-numbered pins are used for higher-numbered bits in the ID. For example, the Accelnet panel amplifier has 12 general purpose input pins (0 to 11). If 3 of these pins are used for ID configuration and the default mapping is used, then the highest 3 pins (9, 10 and 11) will be used for the ID. In this case, pin 9 is bit 0, pin 10 is bit 1 and pin 11 is bit 2. If bit 31 is set, then the rest of this register is used to define which input pin is assigned to which bit of the ID. The input pins are numbered from 0 to 15 and each nibble of the register gives the input pin number associated with one bit of the ID.

For example, if three input pins are configured for address selection and the mapping register is set to 0x80000012, then input pin 2 is used for ID bit 0, input pin 1 is used for ID bit 1, and input pin 0 is used for ID bit 2.

Note that the CAN node ID is calculated at startup only. The input pins assigned to the node ID are sampled once during power up and used to calculate the ID. These pins may be assigned other uses after power up if necessary.

CAN ID SELECTION SWITCH VALUE**INDEX 0x2197**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	0 - 15	YES	-

Description

This object gives the current state of the CAN address switch. For amplifiers that do not have a switch, the value returned is undefined.

MULTI-MODE PORT CONFIGURATION**INDEX 0x2241**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	YES	RF

Description

Multi-mode Port Configuration. The available settings are:

Value	Description
0	Output buffered primary encoder (hardware buffering).
1	Configure pins as inputs.
2	Output simulated encoder outputs tracking motor encoder.
3	Output simulated encoder outputs tracking position encoder.

SUPPORTED DRIVE MODES**INDEX 0x6502**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	See <i>Description</i> , below.	NO	-

Description

This bit-mapped value gives the modes of operation supported by the amplifier.

The standard device profile (DSP402) defines several modes of operation. Each mode is assigned one bit in this variable. A drive indicates its support for the mode of operation by setting the corresponding bit. The modes of operation supported by this device, and their corresponding bits in this object, are as follows:

Bit	Description
0	Position profile mode.
1	Profile velocity mode.
3	Profile torque mode.
5	Homing mode.
6	Interpolated Position Mode.

The current version of amplifier firmware supports only these five modes of operation and the corresponding bits are the only ones set in the object. Therefore the expected value of this object is 0x00000061.

Future versions of Copley Controls CANopen amplifier firmware might support additional operating modes. If so, those versions will return additional values.

AMPLIFIER MODEL NUMBER**INDEX 0x6503**

Type	Access	Units	Range	Map PDO	Memory
String	RO	-	-	NO	-

Description

This ASCII string gives the amplifier model number.

AMPLIFIER MANUFACTURER**INDEX 0x6504**

Type	Access	Units	Range	Map PDO	Memory
Amplifier Manufacturer are given a visible string type	RO	-	-	NO	-

Description

This ASCII string identifies the amplifier's manufacturer as "Copley Controls".

MANUFACTURER'S WEB ADDRESS**INDEX 0x6505**

Type	Access	Units	Range	Map PDO	Memory
String	RO	-	-	NO	-

Description

This ASCII string gives the web address of Copley Controls.

SERVO LOOP CONFIG**INDEX 0x2301**

Type	Access	Units	Range	Map PDO	Memory
Integer32	RW	-	-	YES	RF

Description

This parameter allows various parts of the amplifier servo loops to be enabled/disabled. It's mapped as follows:

Bit	Description
0	If set, this disables the velocity loop gains. The velocity loop command feed forward gain (parameter 0x157) is still active as are the velocity loop output filters.
1	If set, this enables the position loop I and D gains (parameters 0x155 and 0x156). If clear, these parameters are treated as zeros.
2-31	Reserved for future use.

AMPLIFIER DATA**INDEX 0x2384**

Type	Access	Units	Range	Map PDO	Memory
Record	RO	-	-	NO	-

Description

This record lists various amplifier parameters. Sub-index 0 contains the number of sub-elements of this record.

AMPLIFIER SERIAL NUMBER**INDEX 0x2384, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	-	-	NO	-

Description

Gives the amplifier serial number.

AMPLIFIER DATE CODE**INDEX 0x2384, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
String	RO	-	-	NO	-

Description

Date of manufacture of the amplifier.

AMPLIFIER PEAK CURRENT**INDEX 0x2384, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	-

Description

The amplifier's peak current rating.

AMPLIFIER CONTINUOUS CURRENT**INDEX 0x2384, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	-

Description

The amplifier's continuous current rating.

AMPLIFIER PEAK CURRENT TIME**INDEX 0x2384, SUB-INDEX 5**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	milliseconds	-	NO	-

Description

The maximum time for which the amplifier is rated to output peak current.

AMPLIFIER MAXIMUM VOLTAGE**INDEX 0x2384, SUB-INDEX 6**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	-

Description

Maximum bus voltage rating for amplifier.

AMPLIFIER MINIMUM VOLTAGE**INDEX 0x2384, SUB-INDEX 7**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	-

Description

Minimum bus voltage rating for amplifier.

AMPLIFIER VOLTAGE HYSTERESIS**INDEX 0x2384, SUB-INDEX 8**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	-

Description

Hysteresis for maximum bus voltage cut-out.

AMPLIFIER MAXIMUM TEMPERATURE**INDEX 0x2384, SUB-INDEX 9**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	degrees centigrade	-	NO	-

Description

Temperature limit for amplifier.

AMPLIFIER TEMPERATURE HYSTERESIS**INDEX 0x2384, SUB-INDEX 10**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	degrees centigrade	-	NO	-

Description

Hysteresis value for amplifier over temperature cut-out.

AMPLIFIER CURRENT LOOP PERIOD**INDEX 0x2384, SUB-INDEX 11**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	10 nanoseconds	-	NO	-

Description

Current loop update period in 10-nanosecond units.

AMPLIFIER SERVO LOOP PERIOD**INDEX 0x2384, SUB-INDEX 12**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	NO	-

Description

Servo loop update period as a multiple of the current loop period.

AMPLIFIER TYPE CODE**INDEX 0x2384, SUB-INDEX 13**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	See <i>Description</i> , below.	NO	-

Description

Identifies the specific amplifier model. Also known as Amplifier Hardware Type. Identical to [Product Code](#) (index 0x1018, Sub-index 2, p. 74). Go to page 74 (index 0x1018, Sub-index 2) for a table of current defined values.

CURRENT CORRESPONDING TO MAX A/D READING INDEX 0x2384, SUB-INDEX 14

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	F

Amplifier current corresponding to maximum A/D reading.

VOLTAGE CORRESPONDING TO MAX A/D READING INDEX 0x2384, SUB-INDEX 15

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	F

Amplifier voltage corresponding to maximum A/D reading.

ANALOG INPUT SCALING FACTOR INDEX 0x2384, SUB-INDEX 16

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	NO	F

Amplifier analog input scaling factor.

AMPLIFIER MINIMUM PWM OFF TIME INDEX 0x2384, SUB-INDEX 17

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	10 ns	-	NO	F

This fixed amplifier parameter gives the minimum amount of time for which all PWM outputs must be disabled for each current loop cycle.

PWM DEAD TIME AT CONTINUOUS CURRENT LIMIT INDEX 0x2384, SUB-INDEX 18

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	CPU cycles	-	NO	F

This fixed amplifier parameter gives the PWM dead time used at or above the continuous current limit. The dead time below the continuous current limit is a linear function of this parameter and [PWM Dead Time At Zero Current](#) (Index 0x2384, Sub-Index 19, p. 82).

PWM DEAD TIME AT ZERO CURRENT INDEX 0x2384, SUB-INDEX 19

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	CPU cycles	-	NO	F

This fixed amplifier parameter gives the PWM dead time used at or above the continuous current limit. The dead time below the continuous current limit is a linear function of this parameter and [PWM Dead Time At Continuous Current Limit](#) (Index 0x2384, Sub-Index 18 p. 82).

PEAK CURRENT INTERNAL REGEN RESISTOR INDEX 0x2384, SUB-INDEX 20

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	F

The amplifier's peak current rating for its internal regen resistor.

CONTINUOUS CURRENT INTERNAL REGEN RESISTOR INDEX 0x2384, SUB-INDEX 21

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	F

The amplifier's continuous current rating for its internal regen resistor.

TIME AT PEAK CURRENT INTERNAL REGEN RESISTOR INDEX 0x2384, SUB-INDEX 22

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	ms	-	NO	F

The amplifier's maximum time at peak current rating for its internal regen resistor.

ANALOG ENCODER SCALING FACTOR**INDEX 0x2384, SUB-INDEX 23**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	NO	F

This parameter selects the resolution of an analog encoder input. The parameter is not used for other encoder types.

FIRMWARE VERSION NUMBER**INDEX 0x2384, SUB-INDEX 24**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	NO	F

The version number consists of a major version number and a minor version number. The minor number is passed in bits 0-7; the major number is in bits 8-15. For example, the version 1.12 would be encoded 0x010C.

AXIS COUNT**INDEX 0x2384, SUB-INDEX 25**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	NO	F

Returns the number of axis implemented by this amplifier.

INTERNAL REGEN CURRENT**INDEX 0x2384, SUB-INDEX 26**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	mA	-	NO	F

Amplifier internal maximum regen current.

FPGA IMAGE VERSION**INDEX 0x2384, SUB-INDEX 27**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	NO	R

FPGA firmware version number (available on certain amplifier models).

SECONDARY FIRMWARE VERSION**INDEX 0x2384, SUB-INDEX 28**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	NO	R

Firmware version of second processor for amplifiers equipped with two processors.

AMPLIFIER DATA**INDEX 0x6510**

Type	Access	Units	Range	Map PDO	Memory
Record	RO	-	-	NO	-

Description

This object is no longer recommended. Use object 0x2384 (p.80). This record lists various amplifier parameters. Sub-index 0 contains the number of sub-elements of this record.

AMPLIFIER SERIAL NUMBER**INDEX 0x6510, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	-	-	NO	-

Description

Gives the amplifier serial number.

AMPLIFIER DATE CODE**INDEX 0x6510, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
String	RO	-	-	NO	-

Description

Date of manufacture of the amplifier.

AMPLIFIER PEAK CURRENT**INDEX 0x6510, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	-

Description

The amplifier's peak current rating.

AMPLIFIER CONTINUOUS CURRENT**INDEX 0x6510, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	-

Description

The amplifier's continuous current rating.

AMPLIFIER PEAK CURRENT TIME**INDEX 0x6510, SUB-INDEX 5**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	milliseconds	-	NO	-

Description

The maximum time for which the amplifier is rated to output peak current.

AMPLIFIER MAXIMUM VOLTAGE**INDEX 0x6510, SUB-INDEX 6**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	-

Description

Maximum bus voltage rating for amplifier.

AMPLIFIER MINIMUM VOLTAGE**INDEX 0x6510, SUB-INDEX 7**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	-

Description

Minimum bus voltage rating for amplifier.

AMPLIFIER VOLTAGE HYSTERESIS**INDEX 0x6510, SUB-INDEX 8**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	-

Description

Hysteresis for maximum bus voltage cut-out.

AMPLIFIER MAXIMUM TEMPERATURE**INDEX 0x6510, SUB-INDEX 9**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	degrees centigrade	-	NO	-

Description

Temperature limit for amplifier.

AMPLIFIER TEMPERATURE HYSTERESIS**INDEX 0x6510, SUB-INDEX 10**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	degrees centigrade	-	NO	-

Description

Hysteresis value for amplifier over temperature cut-out.

AMPLIFIER CURRENT LOOP PERIOD**INDEX 0x6510, SUB-INDEX 11**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	10 nanoseconds	-	NO	-

Description

Current loop update period in 10-nanosecond units.

AMPLIFIER SERVO LOOP PERIOD**INDEX 0x6510, SUB-INDEX 12**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	NO	-

Description

Servo loop update period as a multiple of the current loop period.

AMPLIFIER TYPE CODE**INDEX 0x6510, SUB-INDEX 13**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	See <i>Description</i> , below.	NO	-

Description

Identifies the specific amplifier model. Also known as Amplifier Hardware Type. Identical to [Product Code](#) (index 0x1018, Sub-index 2, p. 74). Go to page 74 (index 0x1018, Sub-index 2) for a table of current defined values.

CURRENT CORRESPONDING TO MAX A/D READING**INDEX 0x6510, SUB-INDEX 14**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	F

Amplifier current corresponding to maximum A/D reading.

VOLTAGE CORRESPONDING TO MAX A/D READING**INDEX 0x6510, SUB-INDEX 15**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	NO	F

Amplifier voltage corresponding to maximum A/D reading.

ANALOG INPUT SCALING FACTOR**INDEX 0x6510, SUB-INDEX 16**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	NO	F

Amplifier analog input scaling factor.

AMPLIFIER MINIMUM PWM OFF TIME**INDEX 0x6510, SUB-INDEX 17**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	10 ns	-	NO	F

This fixed amplifier parameter gives the minimum amount of time for which all PWM outputs must be disabled for each current loop cycle.

PWM DEAD TIME AT CONTINUOUS CURRENT LIMIT INDEX 0x6510, SUB-INDEX 18

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	CPU cycles	-	NO	F

This fixed amplifier parameter gives the PWM dead time used at or above the continuous current limit. The dead time below the continuous current limit is a linear function of this parameter and [PWM Dead Time At Zero Current](#) ([Index 0x2384, Sub-Index 19, p. 82](#)).

PWM DEAD TIME AT ZERO CURRENT INDEX 0x6510, SUB-INDEX 19

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	CPU cycles	-	NO	F

This fixed amplifier parameter gives the PWM dead time used at or above the continuous current limit. The dead time below the continuous current limit is a linear function of this parameter and [PWM Dead Time At Continuous Current Limit](#) ([Index 0x2384, Sub-Index 18 p. 82](#)).

PEAK CURRENT INTERNAL REGEN RESISTOR INDEX 0x6510, SUB-INDEX 20

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	F

The amplifier's peak current rating for its internal regen resistor.

CONTINUOUS CURRENT INTERNAL REGEN RESISTOR INDEX 0x6510, SUB-INDEX 21

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	NO	F

The amplifier's continuous current rating for its internal regen resistor.

TIME AT PEAK CURRENT INTERNAL REGEN RESISTOR INDEX 0x6510, SUB-INDEX 22

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	ms	-	NO	F

The amplifier's maximum time at peak current rating for its internal regen resistor.

ANALOG ENCODER SCALING FACTOR INDEX 0x6510, SUB-INDEX 23

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	NO	F

This parameter selects the resolution of an analog encoder input. The parameter is not used for other encoder types.

FIRMWARE VERSION NUMBER INDEX 0x6510, SUB-INDEX 24

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	NO	F

The version number consists of a major version number and a minor version number. The minor number is passed in bits 0-7; the major number is in bits 8-15. For example, the version 1.12 would be encoded 0x010C.

AXIS COUNT INDEX 0x6510, SUB-INDEX 25

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	NO	F

Returns the number of axis implemented by this amplifier.

INTERNAL REGEN CURRENT INDEX 0x6510, SUB-INDEX 26

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	mA	-	NO	F

Amplifier internal maximum regen current.

FPGA IMAGE VERSION**INDEX 0x6510, SUB-INDEX 27**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	NO	R

FPGA firmware version number (available on certain amplifier models).

SECONDARY FIRMWARE VERSION**INDEX 0x6510, SUB-INDEX 28**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	NO	R

Firmware version of second processor for amplifiers equipped with two processors.

FIRMWARE VERSION NUMBER (EXTENDED)**INDEX 0x2422**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	-	-	NO	F

Description

Firmware Version Number (extended). The upper 16 bits give the same major/minor version number as [Firmware Version Number](#) ([Index 0x2384, Sub-Index 24](#), p. 83). The lower 16 bits hold a release number (upper byte) and a reserved byte (lower).

DEVICE TYPE**INDEX 0x67FF**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	NO	-

Description

Holds the same data as object 0x1000. Repeated as required by the CANopen specification.

PWM MODE**INDEX 0x2140**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	RF

Description

PWM mode and status. This bit-mapped register allows some details of the PWM output to be controlled and monitored. Fields are described below:

Bit	Description
0	Force bus clamping if set, disable bus clamping if clear. Note that if bit 1 is set, then this bit is ignored.
1	Automatic bus clamping mode if set. Setting this bit causes bus clamping mode to be automatically selected based on the output voltage. Bit 0 is ignored if this bit is set.
3	Factory reserved. If set, DBrk mode is enabled.
4	Use hex voltage limiting if set, circular limiting if clear. This setting is only used with brushless motors.
6	Double PWM frequency if set.
8	Status bit, set when bus clamping is active.

RUNNING SUM OF USER CURRENT LIMIT**INDEX 0x2116**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RO	0.01%	-	YES	R*

Description

Running sum of user current limit.

RUNNING SUM OF AMP CURRENT LIMIT**INDEX 0x2117**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RO	0.01%	-	YES	R*

Description

Running sum of the amp current limit.

D/A CONVERTER CONFIGURATION.**INDEX 0x21E0**

Type	Access	Units	Range	Map PDO	Memory
Integer32	RW	-	-	NO	RF

Description

This parameter sets the mode for the D/A converter on drives so equipped. The bits are mapped as follows:

Bit	Description
0-3	Define the mode of the D/A converter
16-17	Identify the axis associated with the D/A converter
Mode	Description
0	Manual configuration (set using parameter 0x135)
1	Actual current of configured axis

D/A CONVERTER OUTPUT VALUE**INDEX 0x21E1**

Type	Access	Units	Range	Map PDO	Memory
Integer16		mV	-		R

Description

For drives that support an auxiliary D/A converter, this parameter sets the output value in mV units when the D/A is in manual mode. In other modes, the current value being output on the D/A can be read here.

3.5: Basic Motor Configuration Objects

Contents of this Section

Objects described in this section provide access to basic motor parameters. They include:

Motor Model Number	Index 0x6403	91
Motor Manufacturer	Index 0x6404	91
Motor Data	Index 0x2383	91
Motor Type	Index 0x2383, Sub-Index 1	91
Motor Pole Pairs	Index 0x2383, Sub-Index 2	91
Motor Wiring Configuration	Index 0x2383, Sub-Index 3	92
Hall Sensor Type	Index 0x2383, Sub-Index 4	92
Hall Sensor Wiring	Index 0x2383, Sub-Index 5	92
Hall Offset	Index 0x2383, Sub-Index 6	93
Motor Resistance	Index 0x2383, Sub-Index 7	93
Motor Inductance	Index 0x2383, Sub-Index 8	93
Motor Inertia	Index 0x2383, Sub-Index 9	93
Motor Back EMF	Index 0x2383, Sub-index 10	93
Motor Maximum Velocity	Index 0x2383, Sub-Index 11	93
Motor Torque Constant	Index 0x2383, Sub-Index 12	93
Motor Peak Torque	Index 0x2383, Sub-Index 13	94
Motor Continuous Torque	Index 0x2383, Sub-Index 14	94
Motor Temperature Sensor	Index 0x2383, Sub-Index 15	94
Motor Has A Brake	Index 0x2383, Sub-Index 16	94
Motor Stopping Time	Index 0x2383, Sub-Index 17	94
Motor Brake Delay	Index 0x2383, Sub-Index 18	94
Motor Brake Velocity	Index 0x2383, Sub-Index 19	95
Encoder Type Code	Index 0x2383, Sub-Index 20	95
Encoder Units	Index 0x2383, Sub-Index 21	95
Motor Encoder Direction	Index 0x2383, Sub-Index 22	95
Motor Counts/Rev	Index 0x2383, Sub-Index 23	96
Motor Encoder Resolution	Index 0x2383, Sub-Index 24	96
Motor Electrical Distance	Index 0x2383, Sub-Index 25	96
Reserved	Index 0x2383, Sub-Index 26-27	96
Analog Encoder Shift	Index 0x2383, Sub-Index 28	96
Microsteps/Rev	Index 0x2383, Sub-Index 29	96
Load Encoder Type	Index 0x2383, Sub-Index 30	97
Load Encoder Direction	Index 0x2383, Sub-Index 31	97
Load Encoder Resolution	Index 0x2383, Sub-Index 32	97
Bi-Quad Filter Coefficients	Index 0x2383, Sub-Index 33	97
Number of Resolver Cycles/Motor Rev	Index 0x2383, Sub-Index 34	97
Motor Data	Index 0x6410	98
Motor Type	Index 0x6410, Sub-Index 1	98
Motor Pole Pairs	Index 0x6410, Sub-Index 2	98
Motor Wiring Configuration	Index 0x6410, Sub-Index 3	98
Hall Sensor Type	Index 0x6410, Sub-Index 4	98
Hall Sensor Wiring	Index 0x6410, Sub-Index 5	99
Hall Offset	Index 0x6410, Sub-Index 6	99
Motor Resistance	Index 0x6410, Sub-Index 7	99
Motor Inductance	Index 0x6410, Sub-Index 8	99
Motor Inertia	Index 0x6410, Sub-Index 9	100
Motor Back EMF	Index 0x6410, Sub-index 10	100
Motor Maximum Velocity	Index 0x6410, Sub-Index 11	100

MOTOR MODEL NUMBER**INDEX 0x6403**

Type	Access	Units	Range	Map PDO	Memory
String	RW	-	-	NO	F

Description

The motor's model number.

MOTOR MANUFACTURER**INDEX 0x6404**

Type	Access	Units	Range	Map PDO	Memory
String	RW	-	-	NO	F

Description

The motor's manufacturer name.

MOTOR DATA**INDEX 0x2383**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

This record holds a variety of motor parameters.

Note that all motor parameters are stored to non-volatile memory on the amplifier. The programmed values are preserved across power cycles. Sub-index 0 contains the number of sub-elements of this record.

MOTOR TYPE**INDEX 0x2383, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the type of motor connected to the amplifier:

Type	Description
0	Rotary motor.
1	Linear motor.

MOTOR POLE PAIRS**INDEX 0x2383, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 - 32,767	NO	F

Description

Number of motor pole pairs (electrical cycles) per rotation. For example, a 1.8 deg/step motor would require setting motor pole pairs to 50.

This parameter is only used for rotary motors. For linear motors its value is ignored.

MOTOR WIRING CONFIGURATION**INDEX 0x2383, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the direction of the motor wiring:

Type	Description
0	Standard wiring.
1	Motor's U and V wires are swapped.

HALL SENSOR TYPE**INDEX 0x2383, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the type of Hall Effect sensors attached to the motor:

Type	Description
0	No Hall sensors available.
1	Digital Hall sensors.
2	Analog Hall sensors.

HALL SENSOR WIRING**INDEX 0x2383, SUB-INDEX 5**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the wiring of the Hall sensors. Bit-mapped as follows (when analog Halls are used, only bit 8 is relevant):

Bits	Description
0-2	The Hall wiring code (see below).
3	Reserved.
4	Invert W Hall input if set. Inversion occurs after Halls wiring has been modified by bits 0-2.
5	Invert V Hall input if set. Inversion occurs after Halls wiring has been modified by bits 0-2.
6	Invert U Hall input if set. Inversion occurs after Halls wiring has been modified by bits 0-2.
7	Reserved.
8	Swap analog Halls if set.
9-15	Reserved.

The Hall wiring codes define the order of the Hall connections:

Code	Hall ordering
0	U V W
1	U W V
2	V U W
3	V W U
4	W V U
5	W U V
6	Reserved
7	Reserved

HALL OFFSET**INDEX 0x2383, SUB-INDEX 6**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	degrees	-360 - 360	NO	F

Description

Offset angle to be applied to the Hall sensors.

MOTOR RESISTANCE**INDEX 0x2383, SUB-INDEX 7**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 Ohm	0 - 32,767	NO	F

Description

Motor winding resistance, in 0.01-Ohm units.

MOTOR INDUCTANCE**INDEX 0x2383, SUB-INDEX 8**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 milliHenry	0 - 32,767	NO	F

Description

Motor winding inductance, in 0.01-milliHenry units.

MOTOR INERTIA**INDEX 0x2383, SUB-INDEX 9**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.000001 Kg / cm ² Linear: 0.0001 Kg.	0 - 2,147,483,647	NO	F

Description

Motor inertia.

MOTOR BACK EMF**INDEX 0x2383, SUB-INDEX 10**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.01 V/KRPM Linear: 0.01 V/mps	0 - 2,147,483,647	NO	F

Description

Motor back-EMF constant.

MOTOR MAXIMUM VELOCITY**INDEX 0x2383, SUB-INDEX 11**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts / second	0 - 500,000,000	NO	F

Description

Maximum motor velocity.

MOTOR TORQUE CONSTANT**INDEX 0x2383, SUB-INDEX 12**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.001 Nm / Amp Linear: 0.00001 N.	0 - 2,147,483,647	NO	F

Description

Motor Torque (Force) constant.

MOTOR PEAK TORQUE**INDEX 0x2383, SUB-INDEX 13**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.001 Nm Linear: 0.00001 N	0 - 2,147,483,647	NO	F

Description

Motor Peak Torque (Force).

MOTOR CONTINUOUS TORQUE**INDEX 0x2383, SUB-INDEX 14**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.001 Nm/Amp Linear: 0.00001 N/Amp	0 - 2,147,483,647	NO	F

Description

Motor Continuous Torque (Force).

MOTOR TEMPERATURE SENSOR**INDEX 0x2383, SUB-INDEX 15**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Value	Description
0	No temperature sensor available.
1	Temperature sensor is available.

MOTOR HAS A BRAKE**INDEX 0x2383, SUB-INDEX 16**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Value	Description
0	The motor has a brake.
1	The motor does not have a brake.

MOTOR STOPPING TIME**INDEX 0x2383, SUB-INDEX 17**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	milliseconds	0 - 10,000	NO	F

Description

Also known as Brake/Stop Delay Time. When the amplifier is disabled, it will actively decelerate the motor for this amount of time (in milliseconds) before activating the brake output.

This delay may be cut short if the motor velocity falls below the value programmed in [Motor Brake Velocity \(Index 0x2383, Sub-Index 19, p. 95\)](#).

MOTOR BRAKE DELAY**INDEX 0x2383, SUB-INDEX 18**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	milliseconds	0 - 10,000	NO	F

Description

After the brake output is activated, the amplifier will stay enabled for this amount of time to allow the brake to engage.

MOTOR BRAKE VELOCITY**INDEX 0x2383, SUB-INDEX 19**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts / second	0 - 500,000,000	NO	F

Description

During the [Motor Stopping Time](#) ([Index 0x2383, Sub-Index 17](#), p. 94), if the motor's actual velocity falls below this value the brake output is activated immediately.

ENCODER TYPE CODE**INDEX 0x2383, SUB-INDEX 20**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Also known as Motor Encoder Type. Identifies the type of encoder attached to the motor:

Value	Description
0	Primary incremental quadrature encoder.
1	No encoder.
2	Analog encoder.
3	Multi-mode port incremental quadrature encoder
4	Analog Halls used for position feedback.
5	Resolver input.
6	Digital Halls.
7	Analog encoder, special.
8	Yaskawa Sigma-Mini SGMM.
9	Panasonic Minas-A.
10	SPI Command
11	SSI
12	EnDat 2.2

ENCODER UNITS**INDEX 0x2383, SUB-INDEX 21**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

This value defines the units used to describe linear motor encoders. It is not used with rotary motors.

Value	Description
0	microns
1	nanometers
2	millimeters

MOTOR ENCODER DIRECTION**INDEX 0x2383, SUB-INDEX 22**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Motor encoder direction. Value 0 for standard, value 1 to reverse direction.

MOTOR COUNTS/REV**INDEX 0x2383, SUB-INDEX 23**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts / rev	0 - 2,147,483,647	NO	F

Description

For rotary motors gives the number of counts/motor revolution. When a resolver is used as the motor feedback device, this parameter sets the resolution of the interpolated position. This parameter is not used for linear motors.

MOTOR ENCODER RESOLUTION**INDEX 0x2383, SUB-INDEX 24**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	encoder units / count	0 - 32,767	NO	F

Description

Number of [Encoder Units](#) (sub-index 21) / count. Only used with linear motors.

MOTOR ELECTRICAL DISTANCE**INDEX 0x2383, SUB-INDEX 25**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	encoder units / cycle	0 - 2,147,483,647	NO	F

Description

Number of [Encoder Units](#) (sub-index 21) / motor electrical cycle. Only used with linear motors.

RESERVED**INDEX 0x2383, SUB-INDEX 26-27**

Type	Access	Units	Range	Map PDO	Memory
RESERVED	-	-	-	NO	F

Description

Reserved.

ANALOG ENCODER SHIFT**INDEX 0x2383, SUB-INDEX 28**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 -10	NO	F

Description

This value gives the number of bits of interpolation to be applied to an analog encoder. The fundamental encoder resolution will be increased by a multiplier of 2^n where n is the value programmed in this parameter. The range of this value is 0 to 8 giving possible multipliers of 1 to 256.

MICROSTEPS/REV**INDEX 0x2383, SUB-INDEX 29**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	microsteps	-	NO	F

Description

Microsteps per revolution for microstepping motors.

LOAD ENCODER TYPE**INDEX 0x2383, SUB-INDEX 30**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Also known as Position Encoder Type. This bit-mapped value defines the type of encoder attached to the load:

Bits	Description
0-2	Encoder Type (see below).
3	Reserved.
4	Linear encoder if set, rotary encoder if clear.
5	Passive load encoder if set.

The encoder type codes define the type of encoder.

Code	Encoder Type
0	No load encoder present.
1	Primary incremental quadrature encoder.
2	Analog encoder.
3	Multi-mode port incremental quadrature encoder.
4	Low frequency analog encoder
5	Resolver.

LOAD ENCODER DIRECTION**INDEX 0x2383, SUB-INDEX 31**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Also known as Position Encoder Direction. Load encoder direction. Value 0 for standard, value 1 to reverse direction.

LOAD ENCODER RESOLUTION**INDEX 0x2383, SUB-INDEX 32**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	encoder units / count	0 - 2,147,483,647	NO	F

Description

Only used with linear motors. Also known as Position Encoder Resolution. Number of *Encoder Units* / encoder count. For information, see [Encoder Units](#) (Index 0x2383, Sub-Index 21, p. 95).

BI-QUAD FILTER COEFFICIENTS**INDEX 0x2383, SUB-INDEX 33**

Type	Access	Units	Range	Map PDO	Memory
RESERVED	-	-	-	NO	F

Description

Reserved.

NUMBER OF RESOLVER CYCLES/MOTOR REV**INDEX 0x2383, SUB-INDEX 34**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	-	-	-	NO	F

Description

Number of Resolver Cycles/Motor Rev. This parameter is only used with resolver feedback devices.

MOTOR DATA**INDEX 0x6410**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	NO	-

Description

This object is no longer recommended. Use object 0x2383 (p.91). This record holds a variety of motor parameters.

Note that all motor parameters are stored to non-volatile memory on the amplifier. The programmed values are preserved across power cycles. Sub-index 0 contains the number of sub-elements of this record.

MOTOR TYPE**INDEX 0x6410, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the type of motor connected to the amplifier:

Type	Description
0	Rotary motor.
1	Linear motor.

MOTOR POLE PAIRS**INDEX 0x6410, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 - 32,767	NO	F

Description

Number of motor pole pairs (electrical cycles) per rotation. For example, a 1.8 deg/step motor would require setting motor pole pairs to 50.

This parameter is only used for rotary motors. For linear motors its value is ignored.

MOTOR WIRING CONFIGURATION**INDEX 0x6410, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the direction of the motor wiring:

Type	Description
0	Standard wiring.
1	Motor's U and V wires are swapped.

HALL SENSOR TYPE**INDEX 0x6410, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the type of Hall Effect sensors attached to the motor:

Type	Description
0	No Hall sensors available.
1	Digital Hall sensors.
2	Analog Hall sensors.

HALL SENSOR WIRING**INDEX 0x6410, SUB-INDEX 5**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Defines the wiring of the Hall sensors. Bit-mapped as follows (when analog Halls are used, only bit 8 is relevant):

Bits	Description
0-2	The Hall wiring code (see below).
3	Reserved.
4	Invert W Hall input if set. Inversion occurs after Halls wiring has been modified by bits 0-2.
5	Invert V Hall input if set. Inversion occurs after Halls wiring has been modified by bits 0-2.
6	Invert U Hall input if set. Inversion occurs after Halls wiring has been modified by bits 0-2.
7	Reserved.
8	Swap analog Halls if set.
9-15	Reserved.

The Hall wiring codes define the order of the Hall connections:

Code	Hall ordering
0	U V W
1	U W V
2	V U W
3	V W U
4	W V U
5	W U V
6	Reserved
7	Reserved

HALL OFFSET**INDEX 0x6410, SUB-INDEX 6**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	degrees	-360 - 360	NO	F

Description

Offset angle to be applied to the Hall sensors.

MOTOR RESISTANCE**INDEX 0x6410, SUB-INDEX 7**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 Ohm	0 - 32,767	NO	F

Description

Motor winding resistance, in 0.01-Ohm units.

MOTOR INDUCTANCE**INDEX 0x6410, SUB-INDEX 8**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 milliHenry	0 - 32,767	NO	F

Description

Motor winding inductance, in 0.01-milliHenry units.

MOTOR INERTIA**INDEX 0x6410, SUB-INDEX 9**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.000001 Kg / cm ² Linear: 0.0001 Kg.	0 - 2,147,483,647	NO	F

Description

Motor inertia.

MOTOR BACK EMF**INDEX 0x6410, SUB-INDEX 10**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	Rotary: 0.01 V/KRPM Linear: 0.01 V/mps	0 - 2,147,483,647	NO	F

Description

Motor back-EMF constant.

MOTOR MAXIMUM VELOCITY**INDEX 0x6410, SUB-INDEX 11**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts / second	0 - 500,000,000	NO	F

Description

Maximum motor velocity.

MOTOR TORQUE CONSTANT**INDEX 0x6410, SUB-INDEX 12**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.001 Nm / Amp Linear: 0.00001 N.	0 - 2,147,483,647	NO	F

Description

Motor Torque (Force) constant.

MOTOR PEAK TORQUE**INDEX 0x6410, SUB-INDEX 13**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.001 Nm Linear: 0.00001 N	0 - 2,147,483,647	NO	F

Description

Motor Peak Torque (Force).

MOTOR CONTINUOUS TORQUE**INDEX 0x6410, SUB-INDEX 14**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Rotary: 0.001 Nm/Amp Linear: 0.00001 N/Amp	0 - 2,147,483,647	NO	F

Description

Motor Continuous Torque (Force).

MOTOR TEMPERATURE SENSOR**INDEX 0x6410, SUB-INDEX 15**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Value	Description
0	No temperature sensor available.
1	Temperature sensor is available.

MOTOR HAS A BRAKE**INDEX 0x6410, SUB-INDEX 16**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Value	Description
0	The motor has a brake.
1	The motor does not have a brake.

MOTOR STOPPING TIME**INDEX 0x6410, SUB-INDEX 17**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 - 10,000	NO	F

Description

Also known as Brake/Stop Delay Time. When the amplifier is disabled, it will actively decelerate the motor for this amount of time (in milliseconds) before activating the brake output.

This delay may be cut short if the motor velocity falls below the value programmed in [Motor Brake Velocity](#) ([Index 0x2383, Sub-Index 19](#), p. 95).

MOTOR BRAKE DELAY**INDEX 0x6410, SUB-INDEX 18**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 - 10,000	NO	F

Description

After the brake output is activated, the amplifier will stay enabled for this amount of time to allow the brake to engage.

MOTOR BRAKE VELOCITY**INDEX 0x6410, SUB-INDEX 19**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts / second	0 - 500,000,000	NO	F

Description

During the [Motor Stopping Time](#) ([Index 0x2383, Sub-Index 17](#), p. 94), if the motor's actual velocity falls below this value the brake output is activated immediately.

ENCODER TYPE CODE**INDEX 0x6410, SUB-INDEX 20**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Also known as Motor Encoder Type. Identifies the type of encoder attached to the motor:

Value	Description
0	Primary incremental quadrature encoder.
1	No encoder.
2	Analog encoder.
3	Multi-mode port incremental quadrature encoder
4	Analog Halls used for position feedback.
5	Resolver input.
6	Digital Halls.
7	Analog encoder, special.
8	Yaskawa Sigma-Mini SGMM.
9	Panasonic Minas-A.
10	SPI Command
11	SSI
12	EnDat 2.2

ENCODER UNITS**INDEX 0x6410, SUB-INDEX 21**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

This value defines the units used to describe linear motor encoders. It is not used with rotary motors.

Value	Description
0	microns
1	nanometers
2	millimeters

MOTOR ENCODER DIRECTION**INDEX 0x6410, SUB-INDEX 22**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Motor encoder direction. Value 0 for standard, value 1 to reverse direction.

MOTOR COUNTS/REV**INDEX 0x6410, SUB-INDEX 23**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	counts / rev	0 - 2,147,483,647	NO	F

Description

For rotary motors gives the number of counts/motor revolution. When a resolver is used as the motor feedback device, this parameter sets the resolution of the interpolated position. This parameter is not used for linear motors.

MOTOR ENCODER RESOLUTION**INDEX 0x6410, SUB-INDEX 24**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	encoder units / count	0 - 32,767	NO	F

Description

Number of [Encoder Units](#) (sub-index 21) / count. Only used with linear motors.

MOTOR ELECTRICAL DISTANCE**INDEX 0x6410, SUB-INDEX 25**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	encoder units / cycle	0 - 2,147,483,647	NO	F

Description

Number of [Encoder Units](#) (sub-index 21) / motor electrical cycle. Only used with linear motors.

ENCODER INDEX PULSE DISTANCE**INDEX 0x6410, SUB-INDEX 26**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	encoder units / cycle	0 - 2,147,483,647	NO	F

Description

Encoder index pulse distance.

MOTOR UNITS**INDEX 0x6410, SUB-INDEX 27**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	-	NO	F

Description

Number of motor units. This is only used by CME for display.

ANALOG ENCODER SHIFT**INDEX 0x6410, SUB-INDEX 28**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 -10	NO	F

Description

This value gives the number of bits of interpolation to be applied to an analog encoder. The fundamental encoder resolution will be increased by a multiplier of 2^n where n is the value programmed in this parameter. The range of this value is 0 to 8 giving possible multipliers of 1 to 256.

MICROSTEPS/REV**INDEX 0x6410, SUB-INDEX 29**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	microsteps	-	NO	F

Description

Microsteps per revolution for microstepping motors.

LOAD ENCODER TYPE**INDEX 0x6410, SUB-INDEX 30**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Also known as Position Encoder Type. This bit-mapped value defines the type of encoder attached to the load:

Bits	Description
0-2	Encoder Type (see below).
3	Reserved.
4	Linear encoder if set, rotary encoder if clear.
5	Passive load encoder if set.

The encoder type codes define the type of encoder.

Code	Encoder Type
0	No load encoder present.
1	Primary incremental quadrature encoder.
2	Analog encoder.
3	Multi-mode port incremental quadrature encoder.
4	Low frequency analog encoder
5	Resolver.

LOAD ENCODER DIRECTION**INDEX 0x6410, SUB-INDEX 31**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	NO	F

Description

Also known as Position Encoder Direction. Load encoder direction. Value 0 for standard, value 1 to reverse direction.

LOAD ENCODER RESOLUTION**INDEX 0x6410, SUB-INDEX 32**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	encoder units / count	0 - 2,147,483,647	NO	F

Description

Only used with linear motors. Also known as Position Encoder Resolution. Number of *Encoder Units* / encoder count. For information, see [Encoder Units](#) (Index 0x2383, Sub-Index 21, p. 95).

MOTOR GEAR RATIO**INDEX 0x6410, SUB-INDEX 33**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	-	-	NO	F

Description

This parameter may be used to store gear ratio information for dual encoder systems where a gearbox sits between the two encoders. This parameter is not used by the firmware and is supported as a convenience to the CME program.

NUMBER OF RESOLVER CYCLES/MOTOR REV**INDEX 0x6410, SUB-INDEX 34**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	-	NO	F

Description

Number of Resolver Cycles/Motor Rev. This parameter is only used with resolver feedback devices.

MOTOR BRAKE ENABLE DELAY TIME**INDEX 0x2199**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RW	milliseconds	-	NO	F

Description

This parameter gives a delay between enabling the drive PWM outputs and releasing the brake. Positive values mean the PWM is enabled first and then the brake is released N milliseconds later. Negative values cause the brake to be released before PWM outputs are enabled.

MOTOR ENCODER WRAP**INDEX 0x2220**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Counts	-	NO	RF

Description

Actual motor position will wrap back to zero when this value is reached. Setting this value to zero disables this feature.

LOAD ENCODER WRAP**INDEX 0x2221**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Counts	-	NO	RF

Description

Actual load position will wrap back to zero when this value is reached. Setting this value to zero disables this feature.

MOTOR ENCODER OPTIONS**INDEX 0x2222**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	F

Description

Specifies various configuration options for the motor encoder. The mapping of option bits to function depends on the encoder type.

Quadrature Encoder	
Bit	Description
0	If set, ignore differential signal errors (if detected in hardware).
1	If set, select single ended encoder inputs (if available in hardware).
2	Ignore differential signal errors on index input only (if supported by hardware).
<i>Continued...</i>	

...continued:	
EnDat Encoder	
Bit	Description
0-4	Number of bits of single turn data available from encoder.
8-12	Number of bits of multiturn data available from encoder.
16	Set if analog inputs are supplied by encoder.
SSI Encoder	
Bits	Description
0-5	Number of bits of position data available.
8-10	Extra bits after position containing fault info.
12	If set, ignore first received bit.
13	If set, gray code encoded data.
16-21	Encoder bit rate in 100 kHz units
24	If set, first bit is 'data valid'.
Encoded Type 14 (Tamagawa, Panasonic, Harmonic Drives, etc.)	
Bits	Description
0-5	Number of bits of single turn data.
8-12	Number of bits of multi-turn data.
16-19	Number of LSB to discard from reading.
20-22	Number of consecutive CRC errors to ignore.
24-27	Encoder sub-type (0=Tamagawa, 1=Panasonic absolute, 2=HD systems, 3=Panasonic Incremental, 4=Sanyo Denki).
28	Bit rate (set for 4 Mbit, clear for 2.5 Mbit).
BiSS	
Bits	Description
0-5	Number of bits of single turn data.
8-12	Number of bits of multi-turn data.
16	Set for mode-C.
20	If set, error bits are active low.
21	If set, error bits are sent before position, after position (if clear).
24-26	Number of alignment bits.

LOAD ENCODER OPTIONS**INDEX 0x2223**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	NO	F

Description

Specifies various configuration options for the motor encoder. The mapping of option bits to function depends on the encoder type.

Quadrature Encoder	
Bit	Description
0	If set, ignore differential signal errors (if detected in hardware).
1	If set, select single ended encoder inputs (if available in hardware).
EnDat Encoder	
Bit	Description
0-4	Number of bits of single turn data available from encoder.
8-12	Number of bits of multiturn data available from encoder.
16	Set if analog inputs are supplied by encoder.

MOTOR ENCODER STATUS**INDEX 0x2224**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	YES	R*

Description

Motor encoder status. This parameter gives additional status information for the encoder. Bits set in the status word are latched and cleared when the status value is read. The format of this status word is dependent on the encoder type. Many error bits are taken directly from encoder data stream. For a full description of what these error bits mean, please consult the encoder manufacturer.

BiSS	
Bits	Description
0	CRC error on data received from encoder
1	Encoder failed to transmit data to amp
2	Error bit on encoder stream is active
3	Warning bit on encoder stream is active
4	Encoder transmission delay is too long
EnDAT	
Bits	Description
0	CRC error on data received from encoder
1	Failed to detect encoder connected to amplifier
2	Error bit on encoder stream is active
3	Encoder failed to respond to request for position
Tamagawa & Panasonic	
Bits	Description
0	Over speed error reported by encoder
1	Absolute position error reported by encoder
2	Counting error reported by encoder
3	Counter overflow reported by encoder
5	Multi-turn error reported by encoder
6	Battery error reported by encoder
7	Battery warning reported by encoder
8	Error bit 0 reported by encoder
9	Error bit 1 reported by encoder
10	Comm error 0
11	Comm error 1
15	CRC error on data received from encoder
Sanyo Denki & Harmonic Drives (encoder type 14)	
Bits	Description
0	Battery warning reported by encoder
1	Battery error reported by encoder
3	Over speed reported by encoder
4	Memory error reported by encoder
5	STERR reported by encoder
6	PSERR reported by encoder
7	Busy error reported by encoder

LOAD ENCODER STATUS**INDEX 0x2225**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	-	YES	R*

Description

Load encoder status. Same as parameter 0x12E, but for the load encoder.

PHASING MODE**INDEX 0x21C0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	NO	RF

Description

Controls the mechanism used by the amplifier to compute the motor phasing angle. Determines what inputs the amplifier uses to initialize and maintain the phase angle. This variable is normally set using CME and stored to flash, but it can also be accessed via object 0x21C0.

The values that can be programmed into this object are as follows:

Code	Description
0	Standard mode. Use digital Hall inputs to initialize phase, then switch to an encoder to maintain it. The encoder is the primary sensing device with the Hall effect sensors used to monitor and adjust the phase angle as necessary during operation. This mode gives smooth operation and should be selected for most applications.
1	Trapezoidal (hall based) phasing. The Hall sensors are used for phasing all the time. This mode can be used if no encoder is available.
2	Like mode 0 except that the phase angle is not adjusted based on the Hall inputs. Hall sensors are still required to initialize the phase angle at startup.
3	Analog Halls (90°). Only available on amplifier's with the necessary analog inputs.
4	DC Brush.
5	Algorithmic phase init mode (wake & wiggle).
6	Encoder based phasing. Use with resolver or Servo Tube motor.
7	Trapezoidal commutation with phase angle interpolation.

Algorithmic Phase Init Mode Details

When mode 5 is selected the amplifier enters a state machine used to initialize its phase. While the amplifier is performing this operation, bit 29 of the [Manufacturer Status Register \(0x1002\)](#) is set.

At the start of the phase init algorithm the amplifier will wait to be enabled. Once enabled, the main algorithm will start. If the amplifier is disabled during the phase initialization, it will wait to be enabled again and start over.

When the phase init algorithm ends successfully, bit 29 the [Manufacturer Status Register \(0x1002\)](#) is cleared and the amplifier will start using the encoder input to maintain its phasing info. If the algorithm fails for any reason, bit 29 remains set and bit 6 (phase error) is also set in the status word. The amplifier is then disabled.

To restart the phase init algorithm, object 0x21C0 can be written with the value 5. Bit 29 of the status register will immediately be set and the phase init algorithm will restart as soon as the amplifier is enabled.

Note that no profiles can be started until the phase init algorithm is completed.

MAX CURRENT TO USE WITH ALGORITHMIC PHASE INITIALIZATION INDEX 0x21C2

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	-	YES	RF

Description

See [Algorithmic Phase Init Mode Details](#) (p. 108).

ALGORITHMIC PHASE INITIALIZATION TIMEOUT INDEX 0x21C3

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	-	YES	RF

Description

See [Algorithmic Phase Init Mode Details](#) (p. 108).

ALGORITHMIC PHASE INITIALIZATION CONFIG INDEX 0x21C4

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	milliseconds	-	YES	RF

Description

See [Algorithmic Phase Init Mode Details](#) (p. 108). Bit-mapped:

Bits	Description
0	If clear, use algorithmic phase initialization. If set force the phase angle to zero degrees.
1	If set, increment the initial phase angle by 90 degrees after each failed attempt.
2	If set, use the Hall Offset (Index 0x2383 , Sub-Index 6 , p. 93), as the initial angle for the first attempt.
3-15	Reserved.

SECONDARY ANALOG REFERENCE OFFSET INDEX 0x2314

Type	Access	Units	Range	Map PDO	Memory
Integer16	RW	millivolts	-	YES	RF

Description

Offset for secondary analog reference input.

SECONDARY ANALOG REFERENCE CALIBRATION INDEX 0x2315

Type	Access	Units	Range	Map PDO	Memory
Integer16		millivolts	-		RF

Description

Calibration offset for second analog reference input.

3.6: Real-time Amplifier and Motor Status Objects

Contents of this Section

This section describes the following objects:

Analog/Digital Reference Input Value	Index 0x2200.....	111
High Voltage Reference	Index 0x2201	111
Amplifier Temperature	Index 0x2202.....	111
System Time	Index 0x2141	111
Winding A Current	Index 0x2203	111
Winding B Current	Index 0x2204	111
Sine Feedback Voltage	Index 0x2205	111
Cosine Feedback Voltage	Index 0x2206	112
A/D Offset Value	Index 0x2207.....	112
Current Offset A	Index 0x2210	112
Current Offset B	Index 0x2211	112
Stator Current X	Index 0x2212	112
Stator Voltage- X Axis	Index 0x221A	112
Stator Voltage- Y Axis	Index 0x221B	112
RMS Current Calculation Period	Index 0x2114	113
RMS current over set period	Index 0x2115	113
Motor Phase Angle	Index 0x2260.....	113
Motor Phase Angle	Index 0x2262.....	113
Encoder Phase Angle	Index 0x2263.....	113
Hall State	Index 0x2261.....	113
Digital Command Input Scaling Factor	Index 0x2321	114

ANALOG/DIGITAL REFERENCE INPUT VALUE**INDEX 0x2200**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	millivolts	-	YES	-

Description

Most recent value read from the reference A/D input (millivolts). Available on certain amplifiers.

HIGH VOLTAGE REFERENCE**INDEX 0x2201**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 volts	-	YES	-

Description

The voltage present on the high-voltage bus. Also known as Bus Voltage.

AMPLIFIER TEMPERATURE**INDEX 0x2202**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	degrees centigrade	-	YES	R

Description

The amplifier temperature.

SYSTEM TIME**INDEX 0x2141**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	milliseconds	-	YES	R

Description

Time since startup.

WINDING A CURRENT**INDEX 0x2203**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

The current present on one of the motor windings (0.01-amp units).

WINDING B CURRENT**INDEX 0x2204**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

The current present on one of the motor windings (0.01-amp units).

SINE FEEDBACK VOLTAGE**INDEX 0x2205**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	millivolts	-	YES	-

Description

The voltage present on the analog feedback, sine input (millivolts). Not available on all amplifiers. Also known as analog Sine Input Voltage.

COSINE FEEDBACK VOLTAGE**INDEX 0x2206**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	millivolts	-	YES	-

Description

Voltage present on the analog feedback, cosine input (millivolts). Available on certain amplifiers.

A/D OFFSET VALUE**INDEX 0x2207**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	millivolts	-	YES	-

Description

Primarily of diagnostic interest, this object gives the offset value applied to the internal A/D unit. It is part of a continuous calibration routine that the amplifier performs on itself while running.

CURRENT OFFSET A**INDEX 0x2210**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	-	YES	-

Description

A calibration offset value, calculated at startup, and applied to the winding A current reading.

CURRENT OFFSET B**INDEX 0x2211**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	-	YES	-

Description

A calibration offset value, calculated at startup, and applied to the winding B current reading.

STATOR CURRENT X**INDEX 0x2212**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

X axis of calculated stator current vector. Units: 0.01 A.

STATOR VOLTAGE- X AXIS**INDEX 0x221A**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RO	0.01 amps	-	YES	R*

Description

X axis of stator output voltage vector.

STATOR VOLTAGE- Y AXIS**INDEX 0x221B**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RO	0.01 amps	-	YES	R*

Description

Y axis of stator output voltage vector.

RMS CURRENT CALCULATION PERIOD**INDEX 0x2114**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RW	milliseconds	-	YES	RF

Description

This sets the period over which the RMS current is calculated. If this value is set to zero, then the RMS current will be updated each time it is read for the period since the last read. In this case, the RMS current must be read at least once every 65536 current loop periods (about every 4 seconds) for the returned RMS values to be accurate.

RMS CURRENT OVER SET PERIOD**INDEX 0x2115**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RO	0.01 amps	-	YES	RF

Description

RMS current over the period set in parameter 0x130.

MOTOR PHASE ANGLE**INDEX 0x2260**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	R	degrees	0 - 360	YES	R

Description

Motor phase angle, derived from motor commutation.

MOTOR PHASE ANGLE**INDEX 0x2262**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	degrees	0 - 360	YES	R

Description

Same as 0x2260 but writeable. Writes are only useful when running in diagnostic micro-stepping mode.

ENCODER PHASE ANGLE**INDEX 0x2263**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	degrees	0 - 360	YES	R

Description

For feedback types, such as resolver, that can also calculate phase angle information. This parameter allows the phase information to be read directly.

HALL STATE**INDEX 0x2261**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	0 - 7	YES	-

Description

The lower three bits of the returned value give the present state of the Hall input pins.

The Hall state is the value of the Hall lines AFTER the ordering and inversions specified in the Hall wiring configuration have been applied.

DIGITAL COMMAND INPUT SCALING FACTOR**INDEX 0x2321**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	-	-	YES	-

Description

This value gives the amount of current to command at 100% PWM input.

3.7: Digital I/O Configuration Objects

Contents of this Section

This section describes the following objects:

Input Pin States Index 0x2190	116
Input Pin State Index 0x219A	116
Input Pin Config register (16 Bit) Index 0x2191	117
Input Pin Config Register (32 bit) Index 0x219C	117
Input Pin Configuration Index 0x2192	118
Input Pin Configuration Index 0x2192, Sub-Index 1-N	118
Input Pin Debounce Values Index 0x2195	119
Input Pin Debounce Values Index 0x2195, Sub-Index 1-N	119
Raw Input Pin Value (16 bit) Index 0x2196	119
Raw Input Pin Value (32 bit) Index 0x219B	119
Output pin configuration Index 0x2193	120
Output Pin Configuration Index 0x2193, Sub-Index 1-N	120
Output States and Program Control Index 0x2194	121
Digital Control Input Configuration Index 0x2320	121
Digital Control Input Scaling Index 0x2321	122
Digital Inputs Index 0x60FD	122
Configure I/O Options Index 0x2198	122

INPUT PIN STATES**INDEX 0x2190**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	See <i>Description</i> , below	YES	-

Description

The 16-bit value returned by this command gives the current state (high/low) of the amplifier's input pins after debouncing. The inputs are returned one per bit as shown below.

Bits	Description
0	Input 1
1	Input 2
2	Input 3
3	Input 4
4	Input 5
5	Input 6
6	Input 7
7	Input 8
8	Input 9
9	Input 10
10	Input 11
11	Input 12
12	Input 13
13	Input 14
14	Input 15
15	Input 16

There is a PDO event associated with the input states object that can transmit a PDO any time an input pin changes state.

INPUT PIN STATE**INDEX 0x219A**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	R0	-	-	EVENT	R*

Description

32-bit version of parameter [0x2190](#). Useful on drives with more than 16 input pins.

Some amplifiers have one or more pull-up resistors associated with their general-purpose input pins. On these amplifiers, the state of the pull-ups can be controlled by writing to this register.

This register has one bit for each pull-up resistor available on the amplifier. Setting the bit causes the resistor to pull any inputs connected to it up to the high state when they are not connected. Bits 0 – 7 of this register are used to control pull-up resistor states. Each bit represents an input number. Bit 0 = IN1, bit 1 = IN2, etc.

On amplifiers that allow groups of inputs to be configured as either single ended or differential, bit 8 controls this feature. Set bit 8 to 0 for single ended, 1 for differential.

INPUT PIN CONFIG REGISTER (16 BIT)**INDEX 0x2191**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below	YES	RF

Description

Some amplifiers have one or more pull-up resistors associated with their general-purpose input pins. On these amplifiers, the state of the pull-ups can be controlled by writing to this register.

This register has one bit for each pull-up resistor available on the amplifier. Setting the bit causes the resistor to pull any inputs connected to it up to the high state when they are not connected. Bits 0 – 7 of this register are used to control pull-up resistor states. Each bit represents an input number. Bit 0 = IN1, bit 1 = IN2, etc.

On amplifiers that allow groups of inputs to be configured as either single ended or differential, bit 8 controls this feature. Set bit 8 to 0 for single ended, 1 for differential.

INPUT PIN CONFIG REGISTER (32 BIT)**INDEX 0x219C**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	See <i>Description</i> , below	YES	RF

Description

Some amplifiers have one or more pull-up resistors associated with their general-purpose input pins. On these amplifiers, the state of the pull-ups can be controlled by writing to this register.

This register has one bit for each pull-up resistor available on the amplifier. Setting the bit causes the resistor to pull any inputs connected to it up to the high state when they are not connected. Bits 0 – 7 of this register are used to control pull-up resistor states. Each bit represents an input number. Bit 0 = IN1, bit 1 = IN2, etc.

On amplifiers that allow groups of inputs to be configured as either single ended or differential, bit 8 controls this feature. Set bit 8 to 0 for single ended, 1 for differential.

INPUT PIN CONFIGURATION**INDEX 0x2192**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	-	YES	-

Description

This object consists of N identical sub-elements, where N is the number of input pins available on the amplifier. Sub-index 0 contains the number of sub-elements of this array.

INPUT PIN CONFIGURATION**INDEX 0x2192, SUB-INDEX 1-N**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below	NO	RF

These values allow functions to be assigned to each of the input pins. The available functions are:

Code	Description
0	No function
1	Reserved for future use (no function)
2	Reset the amplifier on the rising edge of the input.
3	Reset the amplifier on the falling edge of the input.
4	Positive side limit switch. Active high. See Misc Amplifier Options Register (index 0x2420, p. 76).
5	Positive side limit switch. Active low. See Misc Amplifier Options Register (index 0x2420, p. 76).
6	Negative side limit switch. Active high. See Misc Amplifier Options Register (index 0x2420, p. 76).
7	Negative side limit switch. Active low. See Misc Amplifier Options Register (index 0x2420, p. 76).
8	Motor temperature sensor. Active high.
9	Motor temperature sensor. Active low.
10	Disable amplifier when high. Clear latched faults on low to high transition.
11	Disable amplifier when low. Clear latched faults on high to low transition.
12	Reset on rising edge. Disable amplifier when high.
13	Reset on falling edge. Disable amplifier when low.
14	Home switch. Active high.
15	Home switch. Active low.
16	Disable amplifier when high.
17	Disable amplifier when low.
19	PWM synchronization. Only for high speed inputs; see amplifier data sheet.
20	Halt motor and prevent a new trajectory when high.
21	Halt motor and prevent a new trajectory when low.
22	High resolution analog divide when high.
23	High resolution analog divide when low.
24	High speed position capture on rising edge. Only for high speed inputs.
25	High speed position capture on falling edge. Only for high speed inputs.
26	Counter input, rising edge. Note: Upper byte of this parameter designates which Indexer register to store the count in.
27	Counter input, falling edge. Note: Upper byte of this parameter designates which Indexer register to store the count in.

INPUT PIN DEBOUNCE VALUES**INDEX 0x2195**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	-	YES	-

Description

This object consists of N identical sub-index objects, where N is the number of input pins available on the amplifier. (Sub-index object 0 contains the number of elements of this record.) These values allow debounce times to be assigned to each of the input pins. Each sub-index object can be described as shown below:

INPUT PIN DEBOUNCE VALUES**INDEX 0x2195, SUB-INDEX 1-N**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 - 10,000	YES	RF

Description

The debounce time for the input identified by the sub-index in milliseconds. This time specifies how long an input must remain stable in a new state before the amplifier recognizes the state.

RAW INPUT PIN VALUE (16 BIT)**INDEX 0x2196**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	See <i>Description</i> , below.	YES	-

Description

This object shows the current state of the input pins before debouncing.

The inputs are returned one per bit. The value of IN1 is returned in bit 0 (1 if high, 0 if low), IN2 in bit 1, etc.

For input states with debouncing, see Input Pin States (index 0x2190, p. 116).

RAW INPUT PIN VALUE (32 BIT)**INDEX 0x219B**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	See <i>Description</i> , below.	YES	-

Description

The 32-bit value returned by this command gives the current state (high/low) of the amplifier's input pins. Unlike input pin states, no debounce is applied when reading the inputs using this variable.

The inputs are returned one per bit. The value of IN1 is returned in bit 0 (1 if high, 0 if low), IN2 in bit 1, etc.

For input states with debouncing, see Input Pin States (index 0x2190, p. 116).

OUTPUT PIN CONFIGURATION**INDEX 0x2193**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	-	YES	RF

Description

This array consists of N identical sub-elements, where N is the number of outputs. Sub-index 0 contains the number of sub-elements of this array.

OUTPUT PIN CONFIGURATION**INDEX 0x2193, SUB-INDEX 1-N**

Type	Access	Units	Range	Map PDO	Memory
Variable	RW	-	See <i>Description</i> , below.	YES	RF

The values programmed into these objects allow the amplifier's digital outputs to be driven by internal amplifier events, or externally driven.

Each output configuration consists of a 16-bit configuration word (bits 0-15), followed by a variable number of words (2-4), depending on the configuration code chosen. The configuration word is defined as follows:

Bits	Configuration																		
0-2	Define which internal register drives the output. The acceptable values for these bits are as follows:																		
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Word 2 (bits 16-32) is used as a mask of the amplifier's Manufacturer Status Register object (index 0x1002, p. 60). When any bit set in the mask is also set in the Manufacturer Status Register object, the output goes active.</td></tr> <tr> <td>1</td><td>Word 2 (bits 16-32) is used as a mask of the amplifier's Latched Event Status Register (index 0x2181, p. 62). When any bit set in the mask is also set in the Latched Event Status Register, the output goes active and remains active until the necessary bit in the Latched Event Status Register is cleared.</td></tr> <tr> <td>2</td><td>Puts the output in manual mode. Additional words are not used in this mode, and the output's state follows the value programmed in the manual output control register.</td></tr> <tr> <td>3</td><td>Word 2 (bits 16-32) is used as a mask of the amplifier's Trajectory Generator Status object (index 0x2252, p. 201). When any bit set in the mask is also set in the Trajectory Generator Status object the output goes active.</td></tr> <tr> <td>4</td><td>Output goes active if the actual axis position is between the low position specified in words 2 and 3 (bits 16-47) and the high position specified in words 4 and 5 (bits 48-80).</td></tr> <tr> <td>5</td><td>Output goes active if the actual axis position crosses, with a low to high transition; the position specified in words 2 and 3 (bits 16-47). The output will stay active for number of milliseconds specified in words 4 and 5 (bits 48-80).</td></tr> <tr> <td>6</td><td>Same as 5 but for a high to low crossing.</td></tr> <tr> <td>7</td><td>Same as 5 but for any crossing.</td></tr> </table>	Value	Description	0	Word 2 (bits 16-32) is used as a mask of the amplifier's Manufacturer Status Register object (index 0x1002, p. 60). When any bit set in the mask is also set in the Manufacturer Status Register object, the output goes active.	1	Word 2 (bits 16-32) is used as a mask of the amplifier's Latched Event Status Register (index 0x2181, p. 62). When any bit set in the mask is also set in the Latched Event Status Register , the output goes active and remains active until the necessary bit in the Latched Event Status Register is cleared.	2	Puts the output in manual mode. Additional words are not used in this mode, and the output's state follows the value programmed in the manual output control register.	3	Word 2 (bits 16-32) is used as a mask of the amplifier's Trajectory Generator Status object (index 0x2252, p. 201). When any bit set in the mask is also set in the Trajectory Generator Status object the output goes active.	4	Output goes active if the actual axis position is between the low position specified in words 2 and 3 (bits 16-47) and the high position specified in words 4 and 5 (bits 48-80).	5	Output goes active if the actual axis position crosses, with a low to high transition; the position specified in words 2 and 3 (bits 16-47). The output will stay active for number of milliseconds specified in words 4 and 5 (bits 48-80).	6	Same as 5 but for a high to low crossing.	7	Same as 5 but for any crossing.
Value	Description																		
0	Word 2 (bits 16-32) is used as a mask of the amplifier's Manufacturer Status Register object (index 0x1002, p. 60). When any bit set in the mask is also set in the Manufacturer Status Register object, the output goes active.																		
1	Word 2 (bits 16-32) is used as a mask of the amplifier's Latched Event Status Register (index 0x2181, p. 62). When any bit set in the mask is also set in the Latched Event Status Register , the output goes active and remains active until the necessary bit in the Latched Event Status Register is cleared.																		
2	Puts the output in manual mode. Additional words are not used in this mode, and the output's state follows the value programmed in the manual output control register.																		
3	Word 2 (bits 16-32) is used as a mask of the amplifier's Trajectory Generator Status object (index 0x2252, p. 201). When any bit set in the mask is also set in the Trajectory Generator Status object the output goes active.																		
4	Output goes active if the actual axis position is between the low position specified in words 2 and 3 (bits 16-47) and the high position specified in words 4 and 5 (bits 48-80).																		
5	Output goes active if the actual axis position crosses, with a low to high transition; the position specified in words 2 and 3 (bits 16-47). The output will stay active for number of milliseconds specified in words 4 and 5 (bits 48-80).																		
6	Same as 5 but for a high to low crossing.																		
7	Same as 5 but for any crossing.																		
3-7	Reserved for future use.																		
8	If set, the output is active low. If clear, the output is active high.																		
9-15	Reserved for future use.																		

OUTPUT STATES AND PROGRAM CONTROL**INDEX 0x2194**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	EVENT	R

Description

When read, this parameter gives the active/inactive state of the amplifier's general-purpose digital outputs. Each bit represents an input number. Bit 0 = digital output 1 (OUT1), bit 1 = OUT2, etc., up to OUT n , the number of digital outputs on the amplifier. Additional bits are ignored.

Outputs that have been configured for program control can be set by writing to this parameter (see the [Output pin configuration](#) object, index 0x2193, p. 120 for pin configuration details). Set a bit to activate the output. It will be activated high or low according to how it was programmed. Clear a bit to make the output inactive. If an output was not configured for program control it will not be affected.

DIGITAL CONTROL INPUT CONFIGURATION**INDEX 0x2320**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	YES	RF

Description

Defines the configuration of the digital control inputs when the amplifier is running in a mode that uses them as a control source.

The lower 8 bits control the PWM input configuration for controlling current and velocity modes. The upper 8 bits configure the digital inputs when running in position mode.

Bits	Description	
0	If set, use PWM in signed/magnitude mode. If clear, use PWM in 50% duty cycle offset mode.	
1	Invert the PWM input if set.	
2	Invert the sign bit if set.	
3	Allow 100% duty cycle if set. If clear, treat 100% duty cycle as a zero command, providing a measure of safety in case of controller failure or cable break.	
4-7	Reserved for future use.	
8-9	Input pin interpretation for position mode (see below).	
	Value	Description
	0	Step & Direction mode.
	1	Separate up & down counters.
	2	Quadrature encoder input.
10-11	Reserved for future use.	
12	Count falling edges if set, rising edges if clear.	
13	Invert command signal.	
14-15	Selects source of digital position input command.	
	Value	Description
	0	Single ended high speed inputs.
	1	Multi-mode encoder port.
	2	Differential high speed inputs.
	3	Motor encoder port.

DIGITAL CONTROL INPUT SCALING**INDEX 0x2321**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	See <i>Description</i> , below.	See <i>Description</i> , below.	YES	RF

Description

When the amplifier is running in a mode that takes input from the digital control input pins (as determined by the setting of object [0x2300, Desired State](#)), this object gives the amount of current to command at 100% PWM input. The scaling depends on what the PWM input is driving:

Current mode: 0.01 A

Velocity: 0.1 counts/s

In position mode the scaling factor is a ratio of two 16-bit values. The first word passed gives the numerator and the second word gives the denominator. This ratio determines the number of encoder units moved for each pulse (or encoder count) input.

For example, a ratio of 1/3 would cause the motor to move 1 encoder unit for every three input steps.

DIGITAL INPUTS**INDEX 0x60FD**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	See <i>Description</i> , below.	EVENT	-

Description

This object gives the present value of the digital inputs of the amplifier. The lower 16 bits are defined by the device profile and show the value of input based on the function associated with them. The upper 16 bits give the raw values of the inputs connected to the amplifier in the same ordering as [Input Pin States](#) (index [0x2190](#), p. 116).

Bits	Description
0	Negative limit switch is active when set.
1	Positive limit switch is active when set.
2	Home switch is active when set.
3	Amplifier enable input is active when set.
4-15	Reserved.
16-31	Raw input mapping. These bits contain the same data as Input Pin States (index 0x2190 , p. 116).

CONFIGURE I/O OPTIONS**INDEX 0x2198**

Type	Access	Units	Range	Map PDO	Memory
Integer32	RW	-	-	NO	RF

Description

This parameter is used to configure optional features of the general purpose I/O. Bit-mapped:

Bit	Description
0-3	For AEM/APM, these bits determine whether several I/O pins are used as a serial interface for expanded I/O features, and if so how they are configured. 0 – normal I/O 1 – AEM/APM development board LEDs and address switches. 2 – LEDs wired the same as the developer's kit board, but using separate red & green LEDs for the network status.
4-31	Reserved for future use.

3.8: XENUS REGEN RESISTOR OBJECTS

Contents of this Section

This section describes the following objects:

Xenus Regen Resistor Resistance Index 0x2150	124
Xenus Regen Resistor Continuous Power Index 0x2151	124
Xenus Regen Resistor Peak Power Index 0x2152	124
Xenus Regen Resistor Peak Time Index 0x2153	124
Xenus Regen Resistor Turn-On Voltage Index 0x2154	124
Xenus Regen Resistor Turn-Off Voltage Index 0x2155	124
Xenus Regen Resistor Model String Index 0x2156	124
Xenus Regen Resistor Status Index 0x2157	125

XENUS REGEN RESISITOR RESISTANCE**INDEX 0x2150**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	0.01 Ω	-	YES	RF

Description

Regen resistor resistance.

XENUS REGEN RESISITOR CONTINUOUS POWER**INDEX 0x2151**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	watts	-	YES	RF

Description

Regen resistor, continuous power.

XENUS REGEN RESISITOR PEAK POWER**INDEX 0x2152**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	watts	-	YES	RF

Description

Regen resistor, peak power.

XENUS REGEN RESISITOR PEAK TIME**INDEX 0x2153**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	-	YES	RF

Description

Regen resistor, peak time.

XENUS REGEN RESISITOR TURN-ON VOLTAGE**INDEX 0x2154**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	0.1 Vdc	-	YES	RF

Description

Regen resistor, turn-on voltage.

XENUS REGEN RESISITOR TURN-OFF VOLTAGE**INDEX 0x2155**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	0.1 Vdc	-	YES	RF

Description

Regen resistor, turn-off voltage.

XENUS REGEN RESISITOR MODEL STRING**INDEX 0x2156**

Type	Access	Units	Range	Map PDO	Memory
String	RW	-	-	NO	F

Description

Regen resistor model number string.

XENUS REGEN RESISTOR STATUS**INDEX 0x2157**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	See <i>Description</i> , below.	YES	-

Description

Describes regen system status. Bit-mapped as follows:

Bit	Description
0	Set if the regen circuit is currently closed.
1	Set if regen is required based on bus voltage.
2	Set if the regen circuit is open due to an overload condition. The overload may be caused by either the resistor settings or the internal amplifier protections.
3-15	Reserved for future use.

CHAPTER

4: CONTROL LOOP CONFIGURATION

This chapter describes nested control loop model used by Copley Controls amplifiers to control the position of the motor.

Contents include:

4.1: Control Loop Configuration Overview	128
4.2: Position Loop Configuration Objects.....	135
4.3: Velocity Loop Configuration Objects	142
4.4: Current Loop Configuration Objects	149
4.5: Gain Scheduling Configuration	154
4.6: Chained Biquad Filters.....	155

4.1: Control Loop Configuration Overview

Contents of this Section

This section provides an overview of the control loops.

Topics include:

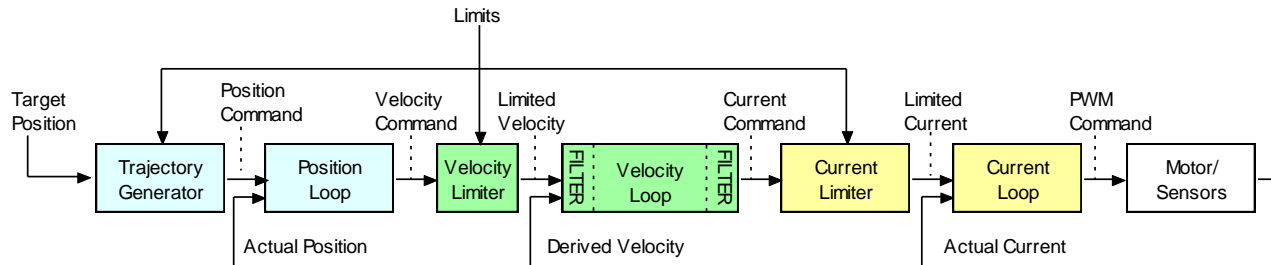

Nested Position, Velocity, and Current Loops.....	129
The Position Loop	130
The Velocity Loop	132
The Current Loop.....	134

Nested Position, Velocity, and Current Loops

Nesting of Control Loops and Modes

Copley Controls amplifiers use up to three nested control loops - current, velocity, and position - to control a motor in three associated operating modes.

In position mode, the amplifier uses all three loops. As shown in the typical system illustrated below, the position loop drives the nested velocity loop, which drives the nested current loop.

In velocity mode, the velocity loop drives the current loop. In current mode, the current loop is driven directly by external or internal current commands.

Basic Attributes of All Control Loops

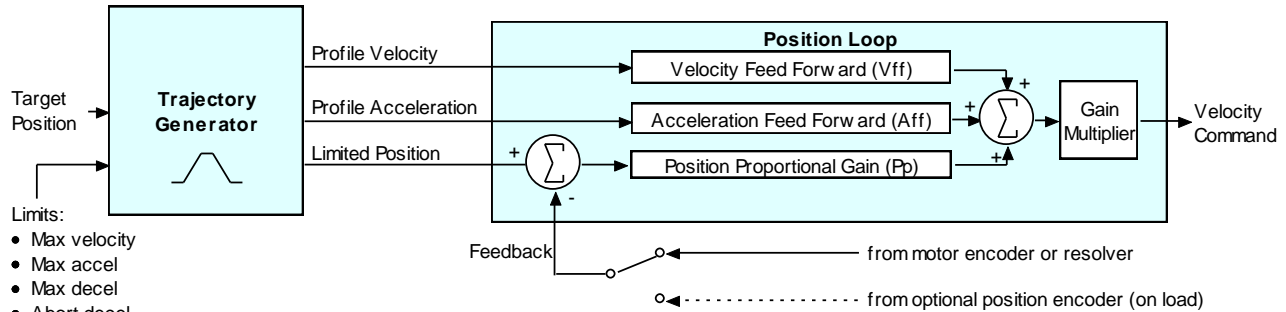

These loops (and servo control loops in general) share several common attributes:

Loop Attribute	Description
Command input	Every loop is given a value to which it will attempt to control. For example, the velocity loop receives a velocity command that is the desired motor speed.
Limits	Limits are set on each loop to protect the motor and/or mechanical system.
Feedback	The nature of servo control loops is that they receive feedback from the device they are controlling. For example, the position loop uses the actual motor position as feedback.
Gains	These are constant values that are used in the mathematical equation of the servo loop. The values of these gains can be adjusted during amplifier setup to improve the loop performance. Adjusting these values is often referred to as <i>tuning</i> the loop.
Output	The loop generates a control signal. This signal can be used as the command signal to another control loop or the input to a power amplifier.

The Position Loop

Position Loop Diagram

The CANopen master provides a target position to the amplifier's internal trajectory generator. In turn the generator provides the position loop a position command and velocity and acceleration limit values. The position loop applies corrective gains in response to feedback to forward a velocity command to the velocity loop. The inputs to the position loop vary with different operating modes. The following diagram summarizes the position loop in position profile mode.

Trajectory Generator Inputs and Limits

The inputs to the trajectory generator include profile position, velocity, and acceleration values. They are accessed through different sets of mode-specific objects as summarized below.

Mode	Input Object Name/ID	Description	Page #
Homing	Homing Method / 0x6098	Defines the method to find the motor home position	183
	Homing Speeds / 0x6099	The sub-index objects of 0x6099 hold the two velocities (fast and slow) used when homing.	184
	Homing Acceleration / 0x609A	Defines the acceleration used for all homing moves.	184
	Home Offset / 0x607C	Used in homing mode as an offset between the home sensor position and the zero position.	184
Profile Position	Motion Profile Type / 0x6086	Selects the type of trajectory profile to use. Choices are trapezoidal, S-curve, and velocity.	204
	Target Position / 0x607A	Destination position of the move.	201
	Profile Velocity / 0x6081	The velocity that the trajectory generator attempts to achieve when running in position profile mode.	202
	Profile Acceleration / 0x6083	Acceleration that the trajectory generator attempts to achieve when running in position profile mode	203
	Profile Deceleration / 0x6084	Deceleration that the trajectory generator attempts to achieve at the end of a trapezoidal profile when running in position profile mode.	202
	Trajectory Jerk Limit / 0x2121	Defines the maximum jerk (rate of change of acceleration) for use with S-curve profile moves.	201
Interpolated Position	IP move segment command / 0x2010	Used to send PVT segment data and buffer commands when running in interpolated position mode.	213

Position Loop Inputs

Inputs from the trajectory generator to the position loop are described below.

Input Object Name/ID	Description	Page #
Instantaneous Commanded Velocity / 0x2250	Velocity to which the position loop's velocity feed forward gain is applied.	136
Instantaneous Commanded Acceleration / 0x2251	Acceleration to which the position loop's acceleration feed forward gain is applied.	136
Position Command Value / 0x6062	Motor position (in units of counts) to which the amplifier is currently trying to move the axis.	136

Position Loop Feedback

The feedback to the loop is the actual motor position, obtained from a position sensor attached to the motor (most often a quadrature encoder). This is provided by [Position Actual Value](#) object (index [0x6063](#), p. [136](#)).

Position Loop Gains

The following gains are used by the position loop to calculate the output value:

Gain	Description
Pp - Position loop proportional	The loop calculates its Position Error (index 0x60F4 , p. 138) as the difference between the Position Actual Value and the Position Command Value . This error in turn is multiplied by the proportional gain value. The primary effect of this gain is to reduce the following error.
Vff - Velocity feed forward	The value of the Instantaneous Commanded Velocity object is multiplied by this value. The primary effect of this gain is to decrease following error during constant velocity.
Aff - Acceleration feed forward	The value of the Instantaneous Commanded Acceleration object is multiplied by this value. The primary effect of this gain is to decrease following error during acceleration and deceleration.

These gains are accessed through the sub-index objects of the [Position Loop Gains](#) object (index [0x2382](#), sub-index 1-6, p. [138](#)).

Position Loop Output

The output of the position loop is a velocity value that is fed to the velocity loop as a command input. This output is associated with two objects, as described below.

Output Object Name/ID	Description	Page #
Velocity Command Value / 0x606B	Velocity that the velocity loop is currently trying to attain. In normal operation, this value is provided by the position loop and is identical to the Position loop control effort. Optionally, the velocity loop can be controlled by one of several alternate control sources. In this case, the Velocity command value comes from the analog reference input, the digital PWM inputs, or the internal function generator.	143
Position Loop Control Effort / Index 0x60FA	Normally, this value is provided by the position loop. When the velocity loop is driven by an alternate control source, the Position loop control effort object does not hold a meaningful value.	138

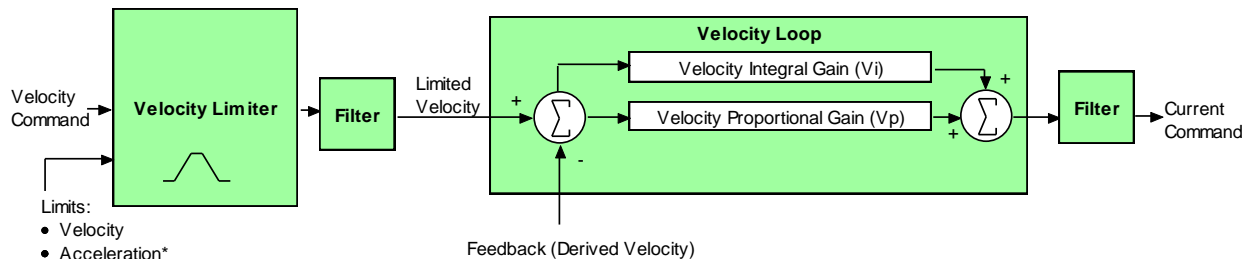

Modulo Count (Position Wrap)

The position variable cannot increase indefinitely. After reaching a certain value the variable rolls back. This type of counting is called modulo count. See bit 21 of the [Manufacturer Status Register](#) object (index [0x1002](#), p. [60](#)).

The Velocity Loop

Overview of the Velocity Loop

As shown below, the velocity loop limiting stage accepts a velocity command, applies limits, and passes a limited velocity command to the input filter. The filter then passes a velocity command to the summing junction. The summing junction subtracts the actual velocity, represented by the feedback signal, and produces an error signal. (The velocity loop feedback signal is always from the motor feedback device even when an additional encoder is attached to the load.) The error signal is then processed using the integral and proportional gains to produce a current command. Programmable digital filters are provided on both the input and output command signals.

Limits:

- Velocity
- Acceleration*
- Deceleration*
- Emergency Stop Deceleration*

*Not used when velocity loop is controlled by position loop. See "Velocity Loop Limits" for details.

Velocity Loop Limits

The velocity loop starts with a command limiter. This is useful because the position loop may produce large spikes in its output velocity command value that are beyond the safe operating range of the motor. During normal operation, with the velocity loop driven by the position loop, the limiter requires and accepts only a maximum velocity value.

Optionally, the velocity loop can be driven by an alternate source of control (such as such as the device's serial port, digital I/O channels, analog reference, or internal generator), without input from the position loop. (See [Alternative Control Sources Overview](#), p. 224.) In these cases, the velocity loop limiter also requires and accepts maximum acceleration and deceleration values. Velocity limiter parameters are accessed through the following objects:

Limiter Object Name/ID	Page #
Velocity Loop – Maximum Velocity / 0x2103 (used in all control modes)	144
*Velocity Loop Maximum Acceleration / 0x2100 (used only without position loop)	143
*Velocity Loop Maximum Deceleration / 0x2101 (used only without position loop)	144
Velocity Loop Emergency Stop Deceleration / 0x2102 (used only without position loop)	144
*Not used when velocity loop is controlled by position loop.	

Velocity Loop Input

The output of the velocity loop limiter is the input of the velocity loop. It is accessed through the object [Limited Velocity](#) (index 0x2230, p. 145).

Velocity Loop Gains

The velocity loop uses the following gains. See (index 0x2381, p. 145).

Gain	Description
Vp - Velocity loop proportional	The velocity error (the difference between the actual and the limited commanded velocity) is multiplied by this gain. The primary effect of this gain is to increase bandwidth (or decrease the step-response time) as the gain is increased.
Vi - Velocity loop integral	The integral of the velocity error is multiplied by this value. Integral gain reduces the velocity error to zero over time. It controls the DC accuracy of the loop, or the flatness of the top of a square wave signal. The error integral is the accumulated sum of the velocity error value over time.

Velocity Loop Filters

The velocity loop contains two programmable digital filters. The input filter should be used to reduce the effects of a noisy velocity command signal. The output filter can be used to reduce the excitation of any resonance in the motion system.

Two filter classes can be programmed: the Low-Pass and the Custom Bi-Quadratic. The Low-Pass filter class includes the Single-Pole and the Two-Pole Butterworth filter types. The Custom Bi-Quadratic filter allows advanced users to define their own filters incorporating two poles and two zeros.

Program the filters using [Velocity Loop Output Filter Coefficients](#) (index [0x2106](#), p. [148](#)) and [Velocity Loop Command Filter Coefficients](#) (index [0x2108](#), p. [148](#)).

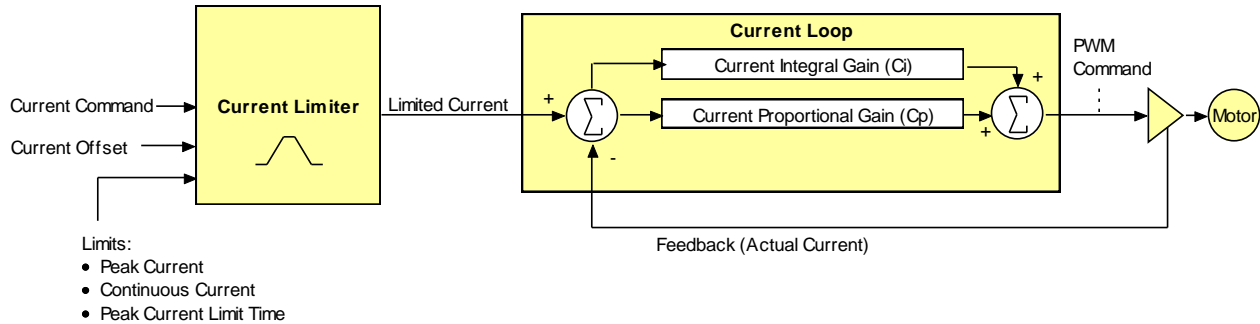

Velocity Loop Output

The output of the velocity loop is accessed in the [Commanded Current](#) object (index [0x221D](#), p. [151](#)).

The Current Loop

Overview of the Current Loop

As shown below, the current limiter accepts a current command from the velocity loop, applies limits, and passes a limited current value to the summing junction. The summing junction takes the commanded current, subtracts the actual current (represented by the feedback signal), and produces an error signal. This error signal is then processed using the integral and proportional gains to produce a command. This command is then applied to the amplifier's power stage.

Current Loop Limits

The commanded current value is first reduced based on a set of current limit parameters designed to protect the motor. These current limits are accessed through the following objects:

Output Object Name/ID	Description	Page #
User Peak Current Limit / 0x2110	Maximum current that can be generated by the amplifier for a short duration of time. This value cannot exceed the peak current rating of the amplifier.	150
User Continuous Current Limit / 0x2111	Maximum current that can be constantly generated by the amplifier.	150
User Peak Current Limit Time / 0x2112	Maximum amount of time that the peak current can be applied to the motor before it must be reduced to the continuous limit.	150

Current Loop Input

The output of the current limiting block is the input to the current loop. It is accessed through the object [Limited Current](#) object (index [0x221E](#), p. 151).

Current Loop Gains

The current loop uses these gains:

Gain	Description
Cp - Current loop proportional	The current error (the difference between the actual and the limited commanded current) is multiplied by this value. The primary effect of this gain is to increase bandwidth (or decrease the step-response time) as the gain is increased.
Ci - Current loop integral	The integral of the current error is multiplied by this value. Integral gain reduces the current error to zero over time. It controls the DC accuracy of the loop, or the flatness of the top of a square wave signal. The error integral is the accumulated sum of the current error value over time.

These gains are represented by (index [0x2380](#), p.148) and its sub-index objects.

Current Loop Output

The output of the current loop is a command that sets the duty cycle of the PWM output stage of the amplifier.

4.2: Position Loop Configuration Objects

Contents of this Section

This section describes the objects used to configure the position control loop.

They include:

Instantaneous Commanded Velocity	Index 0x2250	136
Instantaneous Commanded Acceleration	Index 0x2251	136
Position Command Value	Index 0x6062	136
Position Actual Value	Index 0x6063	136
Position Actual Value	Index 0x6064	136
Tracking Warning Window	Index 0x6065	137
Maximum Slippage-Profile Velocity Mode	Index 0x60F8	137
Position Tracking Window	Index 0x6067	137
Position Tracking Window Time	Index 0x6068	137
Position Error	Index 0x60F4	138
Position Loop Control Effort	Index 0x60FA	138
Position Loop Gains	Index 0x2382	138
Position Loop Proportional Gain	Index 0x2382, Sub-Index 1	138
Position Loop Velocity Feed Forward	Index 0x2382, Sub-Index 2	138
Position Loop Acceleration Feed Forward	Index 0x2382, Sub-Index 3	139
Position Loop Output Gain Multiplier	Index 0x2382, Sub-Index 4	139
Position Loop Gains	Index 0x60FB	139
Position Loop Proportional Gain	Index 0x60FB, Sub-Index 1	139
Position Loop Velocity Feed Forward	Index 0x60FB, Sub-Index 2	139
Position Loop Acceleration Feed Forward	Index 0x60FB, Sub-Index 3	140
Position Loop Output Gain Multiplier	Index 0x60FB, Sub-Index 4	140
Position Command Value	Index 0x60FC	140
Software Position Limits	Index 0x607D	140
Negative Software Limit Position	Index 0x607D, Sub-Index 1	140
Positive Software Limit Position	Index 0x607D, Sub-Index 2	140
Software Limit Deceleration	Index 0x2253	141
Motor Encoder Position	Index 0x2240	141
Load Encoder Position	Index 0x2242	141
Minimum PWM Pulse Width	Index 0x2323	141
Maximum PWM Pulse Width	Index 0x2324	141

INSTANTANEOUS COMMANDED VELOCITY**INDEX 0x2250**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 counts / sec	-	YES	-

Description

This is the velocity output from the trajectory generator. It is the velocity by which the position loop's [Position Loop Velocity Feed Forward](#) gain ([Index 0x2382, Sub-Index 2, p. 138](#)) is multiplied.

INSTANTANEOUS COMMANDED ACCELERATION**INDEX 0x2251**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	10 counts / sec ²	-	YES	-

Description

This is the acceleration output from the trajectory generator. It is the acceleration by which the position loop's [gain](#) ([Index 0x2382, Sub-Index 3, p. 139](#)) is multiplied.

POSITION COMMAND VALUE**INDEX 0x6062**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	R0	counts	-	YES	-

Description

This is the motor position (in units of counts) to which the amplifier is currently trying to move the axis. This value is updated every servo cycle based on the amplifier's internal trajectory generator. Identical to [Position Command Value](#) (index [0x6062, p. 136](#)).

POSITION ACTUAL VALUE**INDEX 0x6063**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	R

Description

This is the actual motor position as calculated by the amplifier every servo cycle based on the state of the encoder input lines, and as used by the position loop. For single encoder systems, this is the same as the [Motor Encoder Position](#) object (index [0x2240](#)). For dual encoder systems, it is the same as [Load Encoder Position](#) (index [0x2242, p. 141](#)).

POSITION ACTUAL VALUE**INDEX 0x6064**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	R

Description

This object holds the same value as [Position Actual Value](#) object (index [0x6063, p. 136](#)).

TRACKING WARNING WINDOW**INDEX 0x6065**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	0 - 2,147,483,647	YES	RF

Description

This object holds the maximum position error that the amplifier will tolerate before indicating a tracking warning. If the absolute position error (defined as the difference between the actual motor position and the position command value) exceeds this window, then the warning bit (bit 19) of the [Manufacturer Status Register](#) (index [0x1002](#), p. 60) is set.

Note that this following error window generates a warning, not an amplifier fault. A separate tracking error window may be programmed which will cause an amplifier fault condition if exceeded. See the [Tracking Error Window](#) object (index [0x2120](#), p. 67) for details.

MAXIMUM SLIPPAGE-PROFILE VELOCITY MODE**INDEX 0x60F8**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	0 - 2,147,483,647	YES	RF

Description

Object 60F8 is included because the *CANopen Profile for Drives and Motion Control (DSP 402)* mandates it for support of profile velocity mode operation. This object is identical to [Tracking Warning Window](#) (index [0x6065](#), p. 137). A change to either object is reflected in the other.

POSITION TRACKING WINDOW**INDEX 0x6067**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	0 - 2,147,483,647	YES	RF

Description

Size of the amplifier's tracking window. When the absolute position error of the motor is less than or equal to the position tracking window value, the motor is considered to be tracking the desired position correctly. This is true both when moving and when resting in position.

The target reached bit (bit 10) is set in the [Status Word](#) (index [0x6041](#), p. 58) when the amplifier has finished running a trajectory, and the position error has been within the position tracking window for the programmed time.

The [Manufacturer Status Register](#) (index [0x1002](#), p. 60) has two bits that are affected by the tracking window. Bit 25 is set any time the motor position has fallen outside the position tracking window (whether in motion or not), and bit 27 is set when the motor position is outside the position tracking window, or the amplifier is in motion.

POSITION TRACKING WINDOW TIME**INDEX 0x6068**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 - 5000	YES	RF

Description

Accesses the time component of the position tracking window. The motor will only be treated as tracking properly when the position error has been within the [Position Tracking Window](#) (index [0x6067](#), p. 137) for at least this long. The tracking window bit (bit 25) in the [Manufacturer Status Register](#) (index [0x1002](#), p. 60) will not be cleared until the position has been within the position tracking window for at least this long.

POSITION ERROR**INDEX 0x60F4**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	counts	-	YES	-

Description

Also known as following error. This object gives the difference, in units of counts, between the [Position Actual Value](#) object (index 0x6063, p. 136) and the [Position Command Value](#) object (index 0x60FC, p. 140).

This value is calculated as part of the position control loop. It is also the value that the various tracking windows are compared to. See [Tracking Warning Window](#) object (index 0x60FC, p. 140), [Position Tracking Window](#) object (index 0x6067, p. 137), and [Tracking Error Window](#) object (index 0x2120, p. 67).

POSITION LOOP CONTROL EFFORT**INDEX 0x60FA**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 counts/sec	-	YES	-

Description

The position loop produces a commanded velocity as its output. This object gives access to that value. This value also represents the input to the velocity loop.

POSITION LOOP GAINS**INDEX 0x2382**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	-

Description

This object contains the various gain values used to optimize the position control loop. Sub-index 0 contains the number of sub-elements of this record.

POSITION LOOP PROPORTIONAL GAIN**INDEX 0x2382, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the position loop error. The position loop error is the difference between the [Position Command Value](#) (index 0x60FC, p. 140) and the [Position Actual Value](#) (index 0x6064, p. 136).

POSITION LOOP VELOCITY FEED FORWARD**INDEX 0x2382, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This value is multiplied by the [Instantaneous Commanded Velocity](#) (index 0x2250, p. 136) generated by the trajectory generator. The product is added to the output of the position loop.

This gain is scaled by 1/16384. Therefore, setting this gain to 0x4000 (16384) would cause the input velocity to be multiplied by 1.0, and the result added to the output of the position loop.

POSITION LOOP ACCELERATION FEED FORWARD**INDEX 0x2382, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 –32,767	YES	RF

Description

This value is multiplied by the [Instantaneous Commanded Acceleration](#) (index 0x2251, p. 136) generated by the trajectory generator. The product is added to the output of the position loop.

POSITION LOOP OUTPUT GAIN MULTIPLIER**INDEX 0x2382, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	YES	RF

Description

The output of the position loop is multiplied by this value before being passed to the velocity loop. This scaling factor is calculated such that a value of 100 is a 1.0 scaling factor.

This parameter is most useful in dual loop systems.

POSITION LOOP GAINS**INDEX 0x60FB**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	-

Description

This object is no longer recommended. Use object 0x2382 (p.138). This object contains the various gain values used to optimize the position control loop. Sub-index 0 contains the number of sub-elements of this record.

POSITION LOOP PROPORTIONAL GAIN**INDEX 0x60FB, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 –32,767	YES	RF

Description

This gain value is multiplied by the position loop error. The position loop error is the difference between the [Position Command Value](#) (index 0x60FC, p. 140) and the [Position Actual Value](#) (index 0x6064, p. 136).

POSITION LOOP VELOCITY FEED FORWARD**INDEX 0x60FB, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 –32,767	YES	RF

Description

This value is multiplied by the [Instantaneous Commanded Velocity](#) (index 0x2250, p. 136) generated by the trajectory generator. The product is added to the output of the position loop.

This gain is scaled by 1/16384. Therefore, setting this gain to 0x4000 (16384) would cause the input velocity to be multiplied by 1.0, and the result added to the output of the position loop.

POSITION LOOP ACCELERATION FEED FORWARD**INDEX 0x60FB, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This value is multiplied by the [Instantaneous Commanded Acceleration](#) (index 0x2251, p. 136) generated by the trajectory generator. The product is added to the output of the position loop.

POSITION LOOP OUTPUT GAIN MULTIPLIER**INDEX 0x60FB, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	YES	RF

Description

The output of the position loop is multiplied by this value before being passed to the velocity loop. This scaling factor is calculated such that a value of 100 is a 1.0 scaling factor.

This parameter is most useful in dual loop systems.

POSITION COMMAND VALUE**INDEX 0x60FC**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	counts	-	YES	-

Description

This value is the output of the trajectory generator, and represents the commanded position input to the position control loop. Each servo cycle the trajectory generator will update this value, and the position loop will attempt to drive the motor to this position. Identical to [Position Command Value](#) (index 0x6062, p. 136).

SOFTWARE POSITION LIMITS**INDEX 0x607D**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	-	YES	-

Description

This array holds the two software position limit values Negative Software Limit Position and Positive Software Limit Position.

NEGATIVE SOFTWARE LIMIT POSITION**INDEX 0x607D, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	RF

Description

Software limits are only in effect after the amplifier has been referenced (i.e. homing has been successfully completed). Set to less than negative software limit to disable.

POSITIVE SOFTWARE LIMIT POSITION**INDEX 0x607D, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	RF

Description

Software limits are only in effect after the amplifier has been referenced (i.e. homing has been successfully completed). Set to greater than positive software limit to disable.

SOFTWARE LIMIT DECELERATION**INDEX 0x2253**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	10 counts / sec ²	0 – 100,000,000	YES	RF

Description

The deceleration rate used when approaching a software limit.

MOTOR ENCODER POSITION**INDEX 0x2240**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	R

Description

For single-encoder systems, this is the same as the [Position Actual Value](#) object (index [0x6063](#), p. [136](#)). For dual-encoder systems this gives the motor position rather than the load encoder position. For more information, see [Load Encoder Velocity](#) (index [0x2231](#), p. [143](#)).

LOAD ENCODER POSITION**INDEX 0x2242**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	R

Description

For dual encoder systems, this object gives the load (position) encoder position and is the same as the [Position Actual Value](#) object (index [0x6063](#), p. [136](#)). For single encoder systems, this object is not used.

MINIMUM PWM PULSE WIDTH**INDEX 0x2323**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	microseconds	-	NO	RF

Description

Minimum PWM pulse width in microseconds. Used when running in PWM position mode. In this mode the PWM input pulse width is captured by the drive and used to calculate an absolute position using the following formula:

$$\text{pos} = ((\text{PW} - \text{MIN}) / (\text{MAX} - \text{MIN})) * \text{SCALE} + \text{OFFSET}$$

where this parameter is the minimum pulse width (MIN), parameter 0x13D is the maximum pulse width (MAX), parameter 0xA9 is the scaling factor (SCALE) and parameter 0x10F is the offset (OFFSET).

MAXIMUM PWM PULSE WIDTH**INDEX 0x2324**

Type	Access	Units	Range	Map PDO	Memory
Integer 16		microseconds	-		RF

Description

Maximum PWM pulse width used when running in PWM position mode.

4.3: Velocity Loop Configuration Objects

Contents of this Section

This section describes the objects used to configure the velocity control loop.

They include:

Velocity Command Value Index 0x606B	143
Actual Velocity Index 0x6069	143
Actual Velocity Index 0x606C	143
Unfiltered Motor Encoder Velocity Index 0x2232	143
Load Encoder Velocity Index 0x2231	143
Velocity Loop Maximum Acceleration Index 0x2100	143
Velocity Loop Maximum Deceleration Index 0x2101	144
Velocity Loop Emergency Stop Deceleration Index 0x2102	144
Velocity Loop – Maximum Velocity Index 0x2103	144
Velocity Error Window – Profile Position Index 0x2104	144
Velocity Error Window – Profile Velocity Index 0x606D	144
Velocity Error Window Time Index 0x2105	145
Velocity Error Window Time Index 0x606E	145
Limited Velocity Index 0x2230	145
Programmed Velocity Command Index 0x2341	145
Velocity Loop Gains Index 0x2381	145
Velocity Loop Proportional Gain Index 0x2381, Sub-Index 1	145
Velocity Loop Integral Gain Index 0x2381, Sub-Index 2	146
Velocity Loop Acceleration Feed Forward Index 0x2381, Sub-Index 3	146
Velocity Loop Gain Scaler Index 0x2381, Sub-Index 4	146
Velocity Loop Vi Drain (Integral Bleed) Index 0x2381, Sub-Index 5	146
Velocity Loop Command Feed Index 0x2381, Sub-Index 6	146
Velocity Loop Gains Index 0x60F9	146
Velocity Loop Proportional Gain Index 0x60F9, Sub-Index 1	146
Velocity Loop Integral Gain Index 0x60F9, Sub-Index 2	147
Velocity Loop Acceleration Feed Forward Index 0x60F9, Sub-Index 3	147
Velocity Loop Gain Scaler Index 0x60F9, Sub-Index 4	147
Velocity Loop Vi Drain (Integral Bleed) Index 0x60F9, Sub-Index 5	147
Velocity Loop Command Feed Index 0x60F9, Sub-Index 6	147
Hall Velocity Mode Shift Value Index 0x2107	147
Velocity Loop Output Filter Coefficients Index 0x2106	148
Velocity Loop Command Filter Coefficients Index 0x2108	148
Analog Input Filter Coefficients Index 0x2109	148

VELOCITY COMMAND VALUE**INDEX 0x606B**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 counts/sec	-	YES	-

Description

Also known as commanded velocity. The velocity that the velocity loop is currently trying to attain.

When the amplifier is running in homing, profile position, or interpolated position mode, the velocity command value is the output of the position loop, and the input to the velocity loop.

Copley Controls CANopen amplifiers support some modes in which the velocity command is produced from a source other than the position loop. In these modes the command velocity comes from the analog reference input, the digital PWM inputs, or the internal function generator.

ACTUAL VELOCITY**INDEX 0x6069**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 enc counts / sec	-	YES	-

Description

Actual motor velocity.

ACTUAL VELOCITY**INDEX 0x606C**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 counts/sec	-	YES	-

Description

This object contains exactly the same information as object 0x6069.

UNFILTERED MOTOR ENCODER VELOCITY**INDEX 0x2232**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 enc counts / sec	-	YES	-

Description

Unfiltered motor velocity.

LOAD ENCODER VELOCITY**INDEX 0x2231**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 counts / sec	-	YES	-

Description

Also known as Position Encoder Velocity. Copley Controls supports the use of two encoders on a system, where the motor encoder is on the motor and the load or position encoder is on the load (the device being controlled). In such a system, the actual velocity objects read the motor encoder velocity, and the velocity loop acts on the motor encoder input. Object 0x2231 reads the load encoder velocity.

VELOCITY LOOP MAXIMUM ACCELERATION**INDEX 0x2100**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	1000 enc counts / sec ²	0 – 100,000,000	YES	RF

Description

This acceleration value limits the maximum rate of change of the commanded velocity input to the velocity loop. This limit only applies when the absolute value of the velocity change is positive (i.e. the speed is increasing in either direction).

VELOCITY LOOP MAXIMUM DECELERATION**INDEX 0x2101**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	1000 enc counts / sec ²	0 – 100,000,000	YES	RF

Description

This acceleration value limits the maximum rate of change of the commanded velocity input to the velocity loop. This limit only applies when the absolute value of the velocity change is negative (i.e. the speed is decreasing in either direction).

VELOCITY LOOP EMERGENCY STOP DECELERATION**INDEX 0x2102**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	1000 enc counts / sec ²	0 – 100,000,000	YES	RF

Description

The deceleration rate used during the time that the amplifier is trying to actively stop a motor before applying the brake output.

Also known as the Velocity Loop Fast Stop Ramp.

Note that this feature is not used when the position loop is driving the velocity loop. In that case, the trajectory generator's abort acceleration is used.

VELOCITY LOOP – MAXIMUM VELOCITY**INDEX 0x2103**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	0 – 500,000,000	YES	RF

Description

This velocity value is a limit on the commanded velocity used by the velocity loop.

Also known as the Velocity Loop Velocity Limit.

The velocity loop's commanded velocity can be generated by several sources, including the output of the position loop. Velocity Loop-Maximum Velocity allows that velocity to be limited to a specified amount.

VELOCITY ERROR WINDOW – PROFILE POSITION**INDEX 0x2104**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	0 – 500,000,000	YES	RF

Description

Also known as the Velocity Tracking Window, this object defines the velocity loop error window. If the absolute velocity error exceeds this value, then the velocity window bit of the [Manufacturer Status Register](#) object (index [0x1002](#), p. 60) is set. The Velocity Window bit will only be cleared when the velocity error has been within the Velocity Error Window for the timeout period defined in the [Velocity Error Window Time](#) object (index [0x2120](#), p. 67).

VELOCITY ERROR WINDOW – PROFILE VELOCITY**INDEX 0x606D**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	0.1 counts/sec	0 – 65,535	YES	RF

Description

Object 606D holds the same value as index [0x2104](#). It is included because the *CANopen Profile for Drives and Motion Control (DSP 402)* mandates it for support of profile velocity mode operation. In the Copley Controls implementation, 0x2104 and 0x606D differ only in the data type. Object 0x606D is unsigned 16 and [0x2104](#) is Integer 32. Changes made to either object affect both.

VELOCITY ERROR WINDOW TIME INDEX 0x2105

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0- 5,000	YES	RF

Description

Also known as Velocity Tracking Time. When the absolute velocity error remains below the limit set in the [Velocity Error Window – Profile Position](#) object (index 0x2104, p. 144) the Velocity Window bit (bit 28) in the [Manufacturer Status Register](#) object (index 0x1002, p. 60) is cleared.

VELOCITY ERROR WINDOW TIME INDEX 0x606E

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0- 5,000	YES	RF

Description

Object 606E holds the same value as 0x2105. It is included because the *CANopen Profile for Drives and Motion Control (DSP 402)* mandates it for support of profile velocity mode operation. Changes made to either 0x606E or 0x2105 affect both objects.

LIMITED VELOCITY INDEX 0x2230

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	0.1 counts/sec	-	YES	-

Description

This is the commanded velocity after it passes through the velocity loop limiter and the velocity command filter. It is the velocity value that the velocity loop will attempt to achieve.

PROGRAMMED VELOCITY COMMAND INDEX 0x2341

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	-500,000,000 – 500,000,000	YES	RF

Description

Gives the commanded velocity value when running in programmed velocity mode (see mode 11, [Desired State](#) object, p. 65, and [Alternative Control Sources Overview](#), p. 224).

VELOCITY LOOP GAINS INDEX 0x2381

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	-

Description

This object contains the various gain values used to optimize the velocity control loop.

VELOCITY LOOP PROPORTIONAL GAIN INDEX 0x2381, SUB-INDEX 1

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the velocity loop error. The velocity loop error is the difference between the desired and actual motor velocity.

VELOCITY LOOP INTEGRAL GAIN**INDEX 0x2381, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the integral of the velocity loop error.

VELOCITY LOOP ACCELERATION FEED FORWARD**INDEX 0x2381, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the [Instantaneous Commanded Acceleration](#) (index [0x2251](#), p. [136](#)) from the trajectory generator. The result is added to the output of the velocity loop.

VELOCITY LOOP GAIN SCALER**INDEX 0x2381, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 – 32,767	YES	RF

Description

Velocity loop output is shifted this many times to arrive at the commanded current value. Positive values result in a right shift while negative values result in a left shift. The shift allows the velocity loop gains to have reasonable values for very high or low resolution encoders. Recommended values for this parameter are 8, 0 or -1.

VELOCITY LOOP Vi DRAIN (INTEGRAL BLEED)**INDEX 0x2381, SUB-INDEX 5**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,000	YES	RF

Description

Modifies the effect of velocity loop integral gain. The higher the Vi Drain value, the faster the integral sum is lowered.

VELOCITY LOOP COMMAND FEED**INDEX 0x2381, SUB-INDEX 6**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,000	YES	RF

Description

The input command (after limiting) to the velocity loop is scaled by this value and added in to the output of the velocity loop.

VELOCITY LOOP GAINS**INDEX 0x60F9**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	-

Description

This object is no longer recommended. Use object 0x2381 ([p.145](#)). This object contains the various gain values used to optimize the velocity control loop.

VELOCITY LOOP PROPORTIONAL GAIN**INDEX 0x60F9, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the velocity loop error. The velocity loop error is the difference between the desired and actual motor velocity. Not recommended. Please use 0x2381.

VELOCITY LOOP INTEGRAL GAIN**INDEX 0x60F9, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the integral of the velocity loop error.

CAN ID 0x60F9 is no longer recommended. Please use 0x2381.

VELOCITY LOOP ACCELERATION FEED FORWARD**INDEX 0x60F9, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the [Instantaneous Commanded Acceleration](#) (index 0x2251, p. 136) from the trajectory generator. The result is added to the output of the velocity loop.

CAN ID 0x60F9 is no longer recommended. Please use 0x2381.

VELOCITY LOOP GAIN SCALER**INDEX 0x60F9, SUB-INDEX 4**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 – 32,767	YES	RF

Description

Velocity loop output is shifted this many times to arrive at the commanded current value. Positive values result in a right shift while negative values result in a left shift. The shift allows the velocity loop gains to have reasonable values for very high or low resolution encoders.

Recommended values for this parameter are 8, 0 or -1.

CAN ID 0x60F9 is no longer recommended. Please use 0x2381.

VELOCITY LOOP V_i DRAIN (INTEGRAL BLEED)**INDEX 0x60F9, SUB-INDEX 5**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,000	YES	RF

Description

Modifies the effect of velocity loop integral gain. The higher the V_i Drain value, the faster the integral sum is lowered.

CAN ID 0x60F9 is no longer recommended. Please use 0x2381.

VELOCITY LOOP COMMAND FEED**INDEX 0x60F9, SUB-INDEX 6**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,000	YES	RF

Description

Velocity loop command feed forward. The input command (after limiting) to the velocity loop is scaled by this value and added in to the output of the velocity loop.

CAN ID 0x60F9 is no longer recommended. Please use 0x2381.

HALL VELOCITY MODE SHIFT VALUE**INDEX 0x2107**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	0 – 32,767	YES	RF

Description

This parameter is only used in Hall velocity mode. It specifies a left shift value for the position and velocity information calculated in that mode.

VELOCITY LOOP OUTPUT FILTER COEFFICIENTS**INDEX 0x2106**

Type	Access	Units	Range	Map PDO	Memory
Octet	RW	-	-	NO	RF

Description

Programs the filter coefficients of a bi-quad filter structure that acts on the velocity loop output. Contact Copley Controls for more information.

VELOCITY LOOP COMMAND FILTER COEFFICIENTS**INDEX 0x2108**

Type	Access	Units	Range	Map PDO	Memory
Octet	RW	-	-	NO	RF

Description

Programs the filter coefficients of a bi-quad filter structure that acts on the velocity loop input. Contact Copley Controls for more information.

ANALOG INPUT FILTER COEFFICIENTS**INDEX 0x2109**

Type	Access	Units	Range	Map PDO	Memory
Octet	RW	-	-	NO	RF

Description

Programs the filter coefficients of a bi-quad filter structure that acts on the analog reference input at servo loop update rate (3 kHz). Contact Copley Controls for more information.

4.4: Current Loop Configuration Objects

Contents of this Section

This section describes the objects used to configure the current control loop.

They include:

User Peak Current Limit	Index 0x2110	150
User Continuous Current Limit	Index 0x2111	150
User Peak Current Limit Time	Index 0x2112	150
Actual Current, D Axis	Index 0x2214	150
Actual Current, Q Axis	Index 0x2215	150
Current Command, D Axis	Index 0x2216	150
Current Command, Q Axis	Index 0x2217	150
Current Loop Output, D Axis	Index 0x2218	151
Current Loop Output, Q Axis	Index 0x2219	151
Actual Motor Current	Index 0x221C	151
Commanded Current	Index 0x221D	151
Limited Current	Index 0x221E	151
Programmed Current Command	Index 0x2340	151
Commanded Current Ramp Rate	Index 0x2113	151
Current Loop Gains	Index 0x2380	152
Current Loop Proportional Gain	Index 0x2380, Sub-Index 1	152
Current Loop Integral Gain	Index 0x2380, Sub-Index 2	152
Current Offset	Index 0x2380, Sub-Index 3	152
Current Loop Gains	Index 0x60F6	152
Current Loop Proportional Gain	Index 0x60F6, Sub-Index 1	152
Current Loop Integral Gain	Index 0x60F6, Sub-Index 2	152
Current Offset	Index 0x60F6, Sub-Index 3	153

USER PEAK CURRENT LIMIT**INDEX 0x2110**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	0 – 32,767	YES	RF

Description

User peak current limit. Known as boost current on stepper amplifiers. This value cannot exceed the peak (or boost) current rating of the amplifier.

USER CONTINUOUS CURRENT LIMIT**INDEX 0x2111**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	0 – 32,767	YES	RF

Description

User Continuous Current Limit. Also known as Run Current on stepper amplifiers. This value should be less than the User Peak Current Limit. The amplifier uses this value as an input to an I^2T current limiting algorithm to prevent over stressing the load.

USER PEAK CURRENT LIMIT TIME**INDEX 0x2112**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 – 10,000	YES	RF

Description

Specifies the maximum time at peak current. The amplifier uses this value as an input to an I^2T current limiting algorithm to prevent over stressing the load.

Also known as Time at Boost Current on stepper amplifiers.

ACTUAL CURRENT, D AXIS**INDEX 0x2214**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	-	YES	-

Description

Part of the internal current loop calculation.

ACTUAL CURRENT, Q AXIS**INDEX 0x2215**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

Part of the internal current loop calculation.

CURRENT COMMAND, D AXIS**INDEX 0x2216**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

Part of the internal current loop calculation.

CURRENT COMMAND, Q AXIS**INDEX 0x2217**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

Part of the internal current loop calculation.

CURRENT LOOP OUTPUT, D AXIS**INDEX 0x2218**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 V	-	YES	-

Description

Part of the internal current loop calculation. Also known as Terminal Voltage Stepper.

CURRENT LOOP OUTPUT, Q AXIS**INDEX 0x2219**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.1 V	-	YES	-

Description

Part of the internal current loop calculation. Also known as Terminal Voltage Servo.

ACTUAL MOTOR CURRENT**INDEX 0x221C**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

Actual motor current.

COMMANDED CURRENT**INDEX 0x221D**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

Instantaneous commanded current as applied to the current limiter.

LIMITED CURRENT**INDEX 0x221E**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	0.01 amps	-	YES	-

Description

Output of the current limiter (input to the current loop).

PROGRAMMED CURRENT COMMAND**INDEX 0x2340**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	-	YES	RF

Description

This object gives the programmed current value used when running in programmed current mode (mode 1) or diagnostic micro-stepping mode (mode 42). (See [Desired State](#) object, p. 65, and [Alternative Control Sources Overview](#), p. 224.)

COMMANDED CURRENT RAMP RATE**INDEX 0x2113**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	mA/second	-	YES	RF

Description

Setting this to zero disables slope limiting in Profile Torque mode. It is also used when the amplifier is running in Programmed Current mode ([Desired State](#) object [index 0x2300, p. 65] = 1).

CURRENT LOOP GAINS**INDEX 0x2380**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	-

Description

This object contains the various gain values used to optimize the current control loop. Sub-index 0 contains the number of sub-elements of this record.

CURRENT LOOP PROPORTIONAL GAIN**INDEX 0x2380, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the current error value. The current error is the difference between the desired current and the actual current.

CURRENT LOOP INTEGRAL GAIN**INDEX 0x2380, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the integral of current error.

CURRENT OFFSET**INDEX 0x2380, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	-	YES	RF

Description

This offset value is added to the commanded motor current. It can be used to compensate for a directional bias affecting the current loop.

CURRENT LOOP GAINS**INDEX 0x60F6**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	-

Description

This object is no longer recommended. Use object 2380 (p.152). This object contains the various gain values used to optimize the current control loop. Sub-index 0 contains the number of sub-elements of this record.

CURRENT LOOP PROPORTIONAL GAIN**INDEX 0x60F6, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the current error value. The current error is the difference between the desired current and the actual current.

CURRENT LOOP INTEGRAL GAIN**INDEX 0x60F6, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	0 – 32,767	YES	RF

Description

This gain value is multiplied by the integral of current error.

CURRENT OFFSET**INDEX 0X60F6, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	0.01 amps	-	YES	RF

Description

This offset value is added to the commanded motor current. It can be used to compensate for a directional bias affecting the current loop.

4.5: Gain Scheduling Configuration

The *Gain Scheduling* feature allows you to schedule gain adjustments based on changes to a key parameter. For instance, Pp, Vp, and Vi could be adjusted based on changes to commanded velocity.

Gain adjustments are specified in a Gain Scheduling Table. Each table row contains a key parameter value and the corresponding gain settings. The amplifier uses linear interpolation to make smooth gain adjustments between the programmed settings.

Gain Scheduling Tables are stored in the Copley Virtual Machine (CVM) memory space. They can be created and modified using CME 2 software.

The following objects are used to configure Gain Scheduling.

GAIN SCHEDULING CONFIG

INDEX 0x2370

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	YES	RF

Description

Bits	Meaning
0-2	Key parameter for gain scheduling.
	Value Description
0	None. Setting the key parameter to zero disables gain scheduling.
1	Use value written to Gain Scheduling Key Parameter (index 0x2371, p. 154) as the key.
2	Use Instantaneous Commanded Velocity (index 0x2250, p. 136).
3	Use Load Encoder Velocity (index 0x2231, p. 143).
4	Use Position Command Value object (index 0x60FC, p. 140).
5	Use Position Actual Value object (index 0x6063, p. 136).
6-7	Reserved.
3-7	Reserved.
8	If set, use the absolute value of key parameter for gain lookup.
9	If set, disable gain scheduling until the axis is referenced (homed).

GAIN SCHEDULING KEY PARAMETER

INDEX 0x2371

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	-	-	YES	R

Description

Gain scheduling key parameter value. When gain scheduling is enabled, the current value of the key parameter is stored here. When this parameter is selected as the key parameter for gain scheduling, then it may be written to manually move through entries in the gain scheduling table.

4.6: Chained Biquad Filters

SECOND CHAINED BIQUAD FILTER

INDEX 0x210A

Type	Access	Units	Range	Map PDO	Memory
14 Word	RW	-	-	NO	RF

Description

Second chained biquad filter on output of velocity loop.

THIRD CHAINED BIQUAD FILTER

INDEX 0x210B

Type	Access	Units	Range	Map PDO	Memory
14 Word	RW	-	-	NO	RF

Description

Third chained biquad filter on output of velocity loop.

FIRST CHAINED BIQUAD FILTER

INDEX 0x210C

Type	Access	Units	Range	Map PDO	Memory
14 Word	RW	-	-	NO	RF

Description

First chained biquad filter on input of current loop.

SECOND CHAINED BIQUAD FILTER

INDEX 0x210D

Type	Access	Units	Range	Map PDO	Memory
14 Word	RW	-	-	NO	RF

Description

Second chained biquad filter on input of current loop.

CHAPTER

5: STEPPER MODE SUPPORT

This chapter describes Copley Controls' support of stepper motor operation over a CANopen network.

Contents include:

5.1: Stepper Mode Operation	158
5.2: Stepper Mode Objects	160

5.1: Stepper Mode Operation

Copley Controls Amplifiers and Stepper Mode Operation

Copley Controls supports the use of stepper motors over a CANopen network.

The Stepnet amplifier can drive a two-phase stepper motor in stepper or servo mode.

The Accelnet and Xenus amplifiers can drive a three-phase stepper motor in stepper mode.

Stepper vs. Servo

In a closed-loop servo system, sensors feed back the actual position and/or velocity of the motor, and the amplifier calculates how much torque to apply to the motor to move it to the target destination.

An open-loop stepper system does not typically have sensors to feed back actual position or velocity information. Nor does it use the position and velocity loops used in servo systems. Instead, the amplifier moves the motor in steps by applying fixed current to the motor's windings in measured intervals. Position and velocity commands can be derived but not measured.

Microstepping

The type of stepper motor supported by the Copley Controls Stepnet amplifier has two windings. It can be driven using the simple full stepping method or the more precise microstepping method. Copley Controls supports microstepping as described in [Microstepping](#) (p. 158).

The Accelnet and Xenus amplifiers support three-phase, three-winding stepper motors. The Accelnet and Xenus also use microstepping to drive these three-phase stepper motors.

Microstepping

Copley Controls' microstepping amplifiers provide a much higher degree of control over a motor's position than does a full stepping system. The microstepping amplifier applies varying amounts of current into both windings of the motor at the same time, making it possible to rest the motor not only at the full step locations, but at points between them, and thus allowing a high degree of control over the motor's position.

In microstepping mode it is necessary to program the following CANopen objects:

Object	Description
Motor Pole Pairs (Index 0x2383 , Sub-Index 2 , p. 91)	Number of motor pole pairs (electrical phases) per rotation. For example, for a 1.8 deg/step motor, set Motor Pair Poles to 50.
Microsteps/Rev (Index 0x2383 , Sub-Index 29 , p. 96)	Microsteps per revolution.

There is virtually no limit on the number of microsteps/rev. Programming a very high value does not mean that the amplifier can actually move the motor to that many distinct positions, because the ability to control current in the windings is limited. The practical limit depends on the motor, but something on the order of 1000 microsteps/electrical cycle is generally reasonable. It is sometimes advantageous to program a large number of microsteps, so the system works as expected when connected to a high resolution encoder.

Some drive manufacturers require that the number of microsteps/rev be an integer multiple of the number of electrical cycles. Copley Controls amplifiers do not have such a limitation.

Current Control in Microstepping Mode

Servo systems use their servo loops to determine how much current (and in which direction) to apply to the motor. For a stepper motor, the amount of current is typically a constant value programmed by the user.

In addition, Copley Controls amplifiers use different current values for different states of motor activity. During constant speed moves, the [Run Current](#) is applied.

During the acceleration / deceleration portion of the move, the [Boost Current](#) is used. After a move completes (the velocity reaches zero) the amplifier continues to apply the [Run Current](#) to the motor for the amount of time programmed in the [Run to Hold Time](#) object. Once that timeout has expired, the [Hold Current](#) is applied.

While [Boost Current](#) is applied to the motor, an I^2T limit is used to protect the motor from overheating. If the move remains in the acceleration phase for longer than the boost current time, then the current applied to the motor falls back to the run current. This allows the system to set the [Run Current](#) value equal to the motor's continuous current limit, and set the [Boost Current](#) to a value larger than the motor's continuous limit.

Once the move has finished and the holding current has been applied to the motor, an optional voltage control mode of operation can be entered. In this mode of operation, the motor is held in position with extremely low jitter at the expense of a slightly looser control of the current in the motor's windings. The [Voltage Control Mode Time Delay](#) object can be programmed to control the delay between entering hold current mode and entering the voltage control mode.

If the [Voltage Control Mode Time Delay](#) is set to zero, the voltage control mode is disabled.

5.2: Stepper Mode Objects

Contents of this Section

This section describes the objects used to support stepper motor operation. Some are also used in servo mode operation.

They include:

Boost Current Index 0x2110	161
Run Current Index 0x2111	161
Time at Boost Current Index 0x2112	161
Hold Current Index 0x21D0.....	161
Run to Hold Time Index 0x21D1.....	161
Detent Correction Gain Factor For Microstepping Mode Index 0x21D2.....	161
Voltage Control Mode Time Delay Index 0x21D5.....	162
Stepper Configuration and Status Index 0x21D6.....	162
Maximum Velocity Adjustment Index 0x21D8.....	162
Proportional Gain For Stepper Outer Loop Index 0x21D7.....	162

BOOST CURRENT**INDEX 0x2110**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	0 – 32,767	YES	RF

Description

Functions as boost current in stepper mode and peak current in servo mode. Current used during acceleration and deceleration in stepper mode. Specifies a boost or peak current limit in 0.01-amp units.

RUN CURRENT**INDEX 0x2111**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01 amps	0 – 32,767	YES	RF

Description

Functions as run current in stepper mode and continuous current in servo mode. Output of the current limiter (0.01-amp units). This is the current that the current loop will attempt to apply to the stepper motor during continuous velocity portion of moves.

TIME AT BOOST CURRENT**INDEX 0x2112**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 – 10,000	YES	RF

Description

Functions as time at boost current in stepper mode and time at peak current in servo mode. Specifies the maximum time at boost or peak current. The amplifier uses this value as an input to an I²T current limiting algorithm to prevent over stressing the load.

HOLD CURRENT**INDEX 0x21D0**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	0.01 amps	0 - 32,767	YES	RF

Description

Current used to hold the motor at rest. Used in stepper mode only.

RUN TO HOLD TIME**INDEX 0x21D1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 - 10,000	YES	RF

Description

The period of time, beginning when a move is completed, during which the output stays at run current level before switching to hold current level. Used in stepper mode only.

DETENT CORRECTION GAIN FACTOR FOR MICROSTEPPING MODE**INDEX 0x21D2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	YES	RF

Description

Can be used to reduce detent noise.

VOLTAGE CONTROL MODE TIME DELAY**INDEX 0x21D5**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 - 10,000	YES	RF

Description

Time delay from entering hold current before entering the special voltage control mode of operation. This mode trades the normal tight control of current for very low jitter on the motor position. Used in stepper mode only. Set to 0 to disable this feature.

STEPPER CONFIGURATION AND STATUS**INDEX 0x21D6**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	-	YES	RF

Description

Bit-mapped as follows:

Bit	Description
0	Use the encoder input for phase compensation if enabled. Pure stepper mode if disabled.
1	Use on outer position loop to adjust the stepper position based on Position Error (index 0x60F4, p. 138). When this bit is set, the gain value Maximum Velocity Adjustment (index 0x21D5, p. 162) is multiplied by the Position Error , and the result is a velocity that is added to the microstepping position.
2-15	Reserved.

MAXIMUM VELOCITY ADJUSTMENT**INDEX 0x21D8**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	0.1 steps/sec	-	YES	RF

Description

This is the maximum velocity adjustment made by the stepper outer position loop when enabled. This parameter is only used when the stepper outer loop is engaged, which occurs when bit 1 of [Stepper Configuration and Status](#) (index 0x21D6, p. 162) is set.

PROPORTIONAL GAIN FOR STEPPER OUTER LOOP**INDEX 0x21D7**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	YES	RF

Description

This parameter gives the gain used for calculating a velocity adjustment based on [Position Error](#) (index 0x60F4, p. 138). This parameter is only used when the stepper outer loop is engaged, which occurs when bit 1 of [Stepper Configuration and Status](#) (index 0x21D6, p. 162) is set.

CHAPTER

6: HOMING MODE OPERATION

This chapter describes the operation of an amplifier in homing mode.

Contents include:

Copley Controls Home Configuration Object for Custom Homing Methods	181

Homing Overview

Homing is the method by which a drive seeks the home position (also called the datum, reference point, or zero point). There are various methods of achieving this using:

- limit switches at the ends of travel, or
- a dedicated home switch.

Most of the methods also use the index pulse input from an incremental encoder.

The amplifier performs homing operations in Homing Mode ([Mode Of Operation](#) [index [0x6060](#), p. [64](#)] =6).

The Homing Function

The homing function provides a set of trajectory parameters to the position loop, as shown below. The parameters are generated by the homing function and are not directly accessible through CANopen dictionary objects. They include the profile mode and velocity, acceleration, and deceleration data.

Initiating and Verifying a Homing Sequence

A homing move is started by setting bit 4 of the [Control Word](#) object (index [0x6040](#), p. [58](#)). The results of a homing operation can be accessed in the [Status Word](#) (index [0x6041](#), p. [58](#)).

Home Offset

The home offset is the difference between the zero position for the application and the machine home position (found during homing). During homing the home position is found and once the homing is completed the zero position is offset from the home position by adding the [Home Offset](#) to the home position. All subsequent absolute moves shall be taken relative to this new zero position. This is illustrated in the following diagram.

Homing Speeds

There are two homing speeds: fast and slow. The fast speed is used to find the home switch and the slow speed is used to find the index pulse. (See the [Homing Speeds](#) object [index [0x6099](#), p. [184](#)])

Homing Acceleration

[Homing Acceleration](#) (index [0x609A](#), p. [184](#)) establishes the acceleration to be used for all accelerations and decelerations with the standard homing modes.

Note that in homing, it is not possible to program a separate deceleration rate.

Homing Methods Overview

There are several homing methods. Each method establishes the:

- Home reference (limit or home switch transition or encoder index pulse)
- Direction of motion and, where appropriate, the relationship of the index pulse to limit or home switches.

Legend to Homing Method Descriptions

As highlighted in the example below, each homing method diagram shows the starting position on a mechanical stage. The arrow line indicates direction of motion, and the circled H indicates the home position. Solid line stems on the index pulse line indicate index pulse locations. Longer dashed lines overlay these stems as a visual aid. Finally, the relevant limit switch is represented, showing the active and inactive zones and transition.

Note that in the homing method descriptions, negative motion is leftward and positive motion is rightward.

Home is Current Position

Using this method, home is the current position.

Set [Homing Method](#) (index 0x6098, p. 183) to: 0.

Home is Current Position; Move to New Zero

Set current position to home and move to new zero position (including home offset). This is the same as [Home is Current Position](#) except that mode 0 does not do the final move to the home position.

Set [Homing Method](#) (index 0x6098, p. 183) to: 35.

Next Index

Direction of Motion: Positive

Home is the first index pulse found in the positive direction. Direction of motion is positive. If a positive limit switch is activated before the index pulse, an error is generated.

Set [Homing Method](#) (index 0x6098, p. 183) to: 34.

Direction of Motion: Negative

Home is the first index pulse found in negative direction. Direction of motion is negative. If a negative limit switch is activated before the index pulse, an error is generated.

Set [Homing Method](#) (index 0x6098, p. 183) to: 33.

Limit Switch

Direction of Motion: Positive

Home is the transition of the positive limit switch. Initial direction of motion is positive if the positive limit switch is inactive.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 18.

Direction of Motion: Negative

Home is the transition of negative limit switch. Initial direction of motion is negative if the negative limit switch is inactive.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 17.

Limit Switch Out to Index

Direction of Motion: Positive

Home is the first index pulse to the negative side of the positive limit switch transition. Initial direction of motion is positive if the positive limit switch is inactive (shown here as low).

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 2.

Direction of Motion: Negative

Home is the first index pulse to the positive side of the negative limit switch transition. Initial direction of motion is negative if the negative limit switch is inactive (shown here as low).

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 1.

Hardstop

Direction of Motion: Positive

Home is the positive hard stop. Direction of motion is positive. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a positive limit switch is activated before the hard stop, an error is generated.

In stepper amplifiers in stepper mode, the hard stop is reached when the following error exceeds the tracking window.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: -1.

Direction of Motion: Negative

Home is the negative hard stop. Direction of motion is negative. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a negative limit switch is activated before the hard stop, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: -2.

Hardstop Out to Index

Direction of Motion: Positive

Home is the first index pulse on the negative side of the positive hard stop. Initial direction of motion is positive. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a positive limit switch is activated before the hard stop, an error is generated.

In stepper amplifiers in stepper mode, the hard stop is reached when the following error exceeds the tracking window.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: -4.

Direction of Motion: Negative

Home is the first index pulse on the positive side of the negative hard stop. Initial direction of motion is negative. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a negative limit switch is activated before the hard stop, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: -3.

Home Switch

Direction of Motion: Positive

Home is the home switch transition. Initial direction of motion is positive if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 19.

Direction of Motion: Negative

Home is the home switch transition. Initial direction of motion is negative if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 21.

Home Switch Out to Index

Direction of Motion: Positive

Home is the first index pulse to the negative side of the home switch transition. Initial direction of motion is positive if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 3.

Direction of Motion: Negative

Home is the first index pulse to the positive side of the home switch transition. Initial direction of motion is negative if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 5.

Home Switch In to Index

Direction of Motion: Positive

Home is the first index pulse to the positive side of the home switch transition. Initial direction of motion is positive if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 4.

Direction of Motion: Negative

Home is the first index pulse to the negative side of the home switch transition. Initial direction of motion is negative if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 6.

Lower Home

Direction of Motion: Positive

Home is the negative edge of a momentary home switch. Initial direction of motion is positive if the home switch is inactive. Motion will reverse if a positive limit switch is activated before the home switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 23.

Direction of Motion: Negative

Home is the negative edge of a momentary home switch. Initial direction of motion is negative. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a positive limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 29.

Upper Home

Direction of Motion: Positive

Home is the positive edge of a momentary home switch. Initial direction of motion is positive. If the initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Set **Homing Method** (index **0x6098**, p. **183**) to: 25

Direction of Motion: Negative

Home is the positive edge of momentary home switch. Initial direction of motion is negative if the home switch is inactive. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a positive limit switch is activated before the home switch, an error is generated.

Set **Homing Method** (index 0x6098, p. 183) to: 27

Lower Home Outside Index

Direction of Motion: Positive

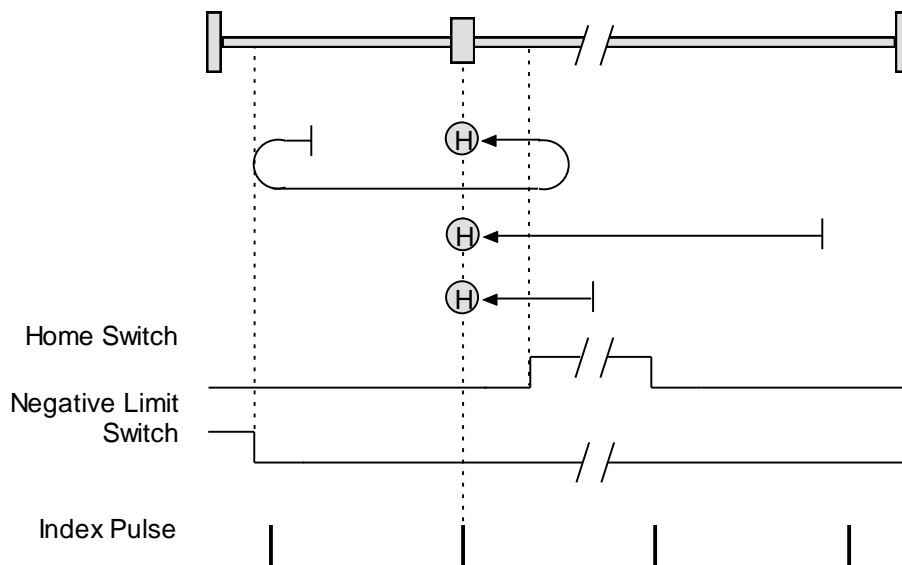

Home is the first index pulse on the negative side of the negative edge of a momentary home switch. Initial direction of motion is positive if the home switch is inactive. If the initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 7.

Direction of Motion: Negative

Home is the first index pulse on the negative side of the negative edge of a momentary home switch. Initial direction of motion is negative. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 14.

Lower Home Inside Index

Direction of Motion: Positive

Home is the first index pulse on the positive side of the negative edge of a momentary home switch. Initial direction of motion is positive if the home switch is inactive. If the initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index 0x6098, p. 183) to: 8.

Direction of Motion: Negative

Home is the first index pulse on the positive side of the negative edge of a momentary home switch. Initial direction of motion is negative. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index 0x6098, p. 183) to: 13.

Direction of Motion: Positive

The timing diagram illustrates the sequence of events for a linear motor drive. The top part shows a mechanical representation of the motor's travel along a track, with a carriage moving from left to right. Below this, three digital signals are plotted over time:

- Home Switch:** This signal is active (high) during the initial homing sequence. It is shown as a pulse that occurs before the carriage reaches the positive limit switch.
- Positive Limit Switch:** This signal is active (high) when the carriage reaches the end of the travel. It is shown as a pulse that occurs after the home switch signal.
- Index Pulse:** This signal is a single pulse that occurs when the carriage reaches the index position, which is located between the home switch and the positive limit switch.

The diagram uses vertical dashed lines to mark the positions of the home switch, the index pulse, and the positive limit switch. The horizontal axis represents time, and the vertical axis represents the digital signal level (high/low).

Direction of Motion: Negative

The timing diagram illustrates the sequence of events for a motor control system. The top part shows a mechanical system with a motor (grey rectangle) and a carriage (white rectangle) moving along a track. The track has a fixed stop (vertical bar) on the left and a limit switch (vertical bar) on the right. The carriage starts at the left stop, moves right, and then stops at the limit switch. Below this, three signals are plotted over time:

- Home Switch:** This signal is active (high) when the carriage is at the left stop. It becomes inactive (low) when the carriage starts moving right. It becomes active again when the carriage stops at the limit switch.
- Negative Limit Switch:** This signal is active (high) when the carriage is at the left stop. It becomes inactive (low) when the carriage starts moving right. It remains inactive throughout the movement.
- Index Pulse:** This signal consists of three short pulses. The first pulse occurs when the carriage starts moving right. The second pulse occurs when the carriage stops at the limit switch. The third pulse occurs when the carriage starts moving left again.

179

Upper Home Inside Index

Direction of Motion: Positive

Home is the first index pulse on the negative side of the positive edge of momentary home switch. Initial direction of motion is positive. If initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 9.

Direction of Motion: Negative

Home is the first index pulse on the negative side of the positive edge of a momentary home switch. Initial direction of motion is negative if the home switch is inactive. If initial motion leads away from the home switch, the axis reverses on encountering the negative limit; then, if a negative limit switch is activated before the home switch, an error is generated.

Set [Homing Method](#) (index [0x6098](#), p. [183](#)) to: 12.

Copley Controls Home Configuration Object for Custom Homing Methods

Copley Controls provides an object that provides access to the amplifier's internal home configuration register. When a standard CANopen homing method is used, the software automatically sets a value in this register.

To specify homing options that are not supported by the standard CANopen methods, the application can directly program this configuration register. This provides finer control of the homing methods than the standard CANopen ones allow.

For example, all of the standard CANopen homing methods will cause a move to the new zero position after it has been found. With a large home offset, this could be a large or slow move. This final move can be avoided by programming the internal home configuration register directly.

6.2: Homing Mode Operation Objects

Contents of this Section

This section describes the objects that control the operation of the amplifier in homing mode.

They include:

Homing Method	Index 0x6098	183
Homing Speeds	Index 0x6099	184
Home Velocity – Fast	Index 0x6099, Sub-Index 1	184
Home Velocity – Slow	Index 0x6099, Sub-Index 2	184
Homing Acceleration	Index 0x609A	184
Home Offset	Index 0x607C	184
Hard Stop Mode Home Delay	Index 0x2351	185
Hard Stop Mode Home Current	Index 0x2350	185
Home Config	Index 0x2352	185
Position Capture Control Register	Index 0x2400	186
Position Capture Status Register	Index 0x2401	186
Captured Index Position	Index 0x2402	187
Home Capture Position	Index 0x2403	187
Time Stamp of Last High Speed Position Capture	Index 0x2404	187
Captured Position for High Speed Position Capture	Index 0x2405	187
Homing Adjustment	Index 0x2353	187

HOMING METHOD**INDEX 0x6098**

Type	Access	Units	Range	Map PDO	Memory
Integer 8	RW	-	See <i>Description</i> , below.	YES	RF

Description

The method for finding the motor home position in homing mode. Program a method described below by writing its code to 0x6098. Most of the methods are paired. Each member of a pair uses the same basic method but starts in the opposite direction and has a distinct code. For a full description of any method, see the referenced pages.

Homing Method	Initial Motion	Code	Full Description #
Hardstop Out to Index	Positive	-4	p. 171
	Negative	-3	
Hardstop	Negative	-2	p. 170
	Positive	-1	
Home is Current Position	Any	0	p. 167
Home is Current Position; Move to New Zero	Any	35	p. 167
Limit Switch Out to Index	Negative	1	p. 169
	Positive	2	
Home Switch Out to Index	Positive	3	p. 173
	Negative	5	
Home Switch In to Index	Positive	4	p. 174

Next Index	Positive	34	p. 167
	Negative	33	
Reserved for future use.	15-16, 20, 22, 24, 26, 28, 30-32		

Note that these homing methods only define the location of the home position. The zero position is always the home position adjusted by the homing offset. See [Homing Methods Overview](#), p. [166](#).

HOMING SPEEDS**INDEX 0x6099**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	-	YES	-

Description

This array holds the two velocities used when homing. Sub-index 0 contains the number of sub-elements of this record.

HOME VELOCITY – FAST**INDEX 0x6099, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	0 – 500,000,000	YES	RF

Description

This velocity value is used during segments of the homing procedure that may be handled at high speed. Generally, this means move in which the home sensor is being located, but the edge of the sensor is not being found.

HOME VELOCITY – SLOW**INDEX 0x6099, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	0 – 500,000,000	YES	RF

Description

This velocity value is used for homing segment that require low speed such as cases where the edge of a homing sensor is being sought.

HOMING ACCELERATION**INDEX 0x609A**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	10 counts/sec ²	0 – 200,000,000	YES	RF

Description

This value defines the acceleration used for all homing moves. The same acceleration value is used at the beginning and ending of moves (i.e. there is no separate deceleration value).

HOME OFFSET**INDEX 0x607C**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	RF

Description

The home offset is the difference between the zero position for the application and the machine home position (found during homing). During homing the home position is found. Once the homing is completed the zero position is offset from the home position by adding the Home Offset to the home position. All subsequent absolute moves shall be taken relative to this new zero position.

See [Home Offset](#) (p. 165) for more information.

HARD STOP MODE HOME DELAY**INDEX 0x2351**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	milliseconds	0 - 10,000	YES	RF

Description

Delay used for homing to a hard stop mode.

HARD STOP MODE HOME CURRENT**INDEX 0x2350**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.01A	0 - 32,767	YES	RF

Description

Home current in hard stop mode, in which the amplifier drives the motor to the mechanical end of travel (hard stop). End of travel is recognized when the amplifier outputs the Hard Stop Mode Home Current for the [Hard Stop Mode Home Delay](#) time (index [0x2351](#), p. 185).

HOME CONFIG**INDEX 0x2352**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	YES	RF

Description

Alternate method for configuring the homing mode. Provides more flexibility than the standard CANopen method does. Bit-mapped as follows:

Bits	Description
0-3	Home function.
	Value Description
0	If bit 5 is not set, then just set the current position as home. If bit 5 is set, then move in the direction specified by bit 4 and set the location of the first index pulse as home. Bit 6 is not used in this mode.
1	Move in the direction specified by bit 4 until a limit switch is encountered. Then move in the other direction out of limit. If bit 5 is clear, then the edge location is home. If bit 5 is set, then the next index pulse is home. Bit 6 is not used in this mode.
2	Home on a constant home switch. The initial move is made in the direction specified by bit 4. When the home switch is encountered, the direction is reversed. The edge of the home switch is set as home if bit 5 is clear. If bit 5 is set, then an index pulse is used as the home position. Bit 6 is used to define which index pulse is used.
3	Home on an intermittent home switch. This mode works the same as mode 2 except that if a limit switch is encountered when initially searching for home, then the direction is reversed. In mode 2, hitting a limit switch before finding home would be considered an error. Bit 8 identifies which edge of the home to search for (positive or negative).
4	Home to a hard stop. This moves in the direction specified in bit 4 until the home current limit is reached. It then presses against the hard stop using that current value until the home delay time expires. If bit 5 (index) is set, drive away from the hard stop until an index is found.
4	Initial move direction (0=positive, 1=negative).
5	Home on index pulse if set.
6	Selects which index pulse to use. If set, use the pulse on the DIR side of the sensor edge. DIR is the direction specified by bit 4 of this word.
7	If set, capture falling edge of index. Capture rising edge if clear.
8	When using a momentary home switch, this bit identifies which edge of the home switch to reference on. If set, then the negative edge is used; if clear the positive edge is used.
9	If set, make a move to the zero position when homing is finished. If clear, the zero position is found, but not moved to.
10	If set, the homing sequence will run as normal, but the actual position will not be adjusted at the end. Note that even though the actual position is not adjusted, the Homing Adjustment (index 0x2353 , p. 187) is updated with the size of the adjustment (in counts) that would have been made. Also, if bit 10 is set then no move to zero is made regardless of the setting of bit 9.

POSITION CAPTURE CONTROL REGISTER**INDEX 0x2400**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	See <i>Description</i> , below.	YES	RF

Description

Sets up position capture features for the encoder index home switch input and high speed position capture input. Bit-mapped as follows:

Bit	Description
0	If set, the Captured Index Position (index 0x2402, p. 187) is captured on the falling edge of the index.
1	If set, the Captured Index Position is captured on the rising edge of the index.
2	If set, a Captured Index Position value will not be overwritten by a new position until it has been read. If clear, new positions will overwrite old positions.
3,4	Reserved.
5	If set, Home Capture Position (index 0x2403, p. 187) captures falling edges of the home switch input transition; if clear, it captures rising edges.
6	If set, Home Capture Position will not be overwritten by a new position until it has been read. If clear, new positions will overwrite old positions.
8	If set, enable high speed input position capture. The position value is written to Captured Position for High Speed Position Capture (index 0x2405, p. 187).
9	If set, don't overwrite high speed input capture positions.
10	If set, a Captured Position for High Speed Position Capture value will not be overwritten by a new position until it has been read. If clear, new positions will overwrite old positions.
12	Clear actual position on every encoder index pulse.

POSITION CAPTURE STATUS REGISTER**INDEX 0x2401**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	See <i>Description</i> , below.	YES	-

Description

Shows the current status of the index or home switch capture mechanism. Bit-mapped as follows:

Bit	Description
0	If set, an index position has been captured. Cleared when the captured position is read.
1,2	Reserved.
3	If set, a new index transition occurred when a captured position was already stored. The existing Captured Index Position (index 0x2402, p. 187) will be overwritten or preserved as programmed in bit 2 of the Position Capture Control Register (index 0x2400, p. 186).
4	If set, new home switch transition data has been captured.
5,6	Reserved.
7	If set, a new home switch input transition occurred when a captured position was already stored. The existing Home Capture Position (index 0x2403, p. 187) will be overwritten or preserved as programmed in bit 6 of the Position Capture Control Register .
8	If set, a new high speed input position has been captured. Cleared when the captured position is read.
10	If set, high speed input position overflow.
11	If set, a new high speed input transition occurred when a Captured Position for High Speed Position Capture (index 0x2405, p. 187) was already stored. The existing Captured Position for High Speed Position Capture will be overwritten or preserved as programmed in bit 10 of the Position Capture Control Register .

CAPTURED INDEX POSITION**INDEX 0x2402**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	counts	-	YES	-

Description

Reading this variable resets bits 0 & 3 of the [Position Capture Status Register](#) (index 0x2401, p. 186). Provides the position that the axis was in when an index pulse was captured. Configured by setting bits in the [Position Capture Control Register](#) (index 0x2400, p. 186), and the status of the captured data can be checked in the [Position Capture Status Register](#). Reading this variable resets bits 0 & 3 of the [Position Capture Status Register](#).

HOME CAPTURE POSITION**INDEX 0x2403**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	counts	-	EVENT	-

Description

Provides the position that the axis was in when an input pin configured as a home switch input became active. This function can be configured by setting bits in the [Position Capture Control Register](#) (index 0x2400, p. 186), and the status of the captured data can be checked in [Position Capture Status Register](#) (index 0x2401, p. 186).

TIME STAMP OF LAST HIGH SPEED POSITION CAPTURE**INDEX 0x2404**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	microseconds	-	EVENT	R

Description

Provides the time when an input pin configured as a high speed capture input became active (and the axis position was captured).

CAPTURED POSITION FOR HIGH SPEED POSITION CAPTURE**INDEX 0x2405**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	counts	-	EVENT	R

Description

Provides the position that the axis was in when an input pin configured as a high speed capture input became active.

HOMING ADJUSTMENT**INDEX 0x2353**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	counts	-	EVENT	R

Description

This parameter is updated after each successful homing operation. The value it contains is the size of the actual position adjustment made in the last home sequence.

CHAPTER

7: PROFILE POSITION, VELOCITY, AND TORQUE MODE OPERATION

This chapter describes the operation of an amplifier in profile position, profile velocity, and profile torque mode.

Contents include:

7.1: Profile Position Mode Operation	190
7.2: Profile Velocity Mode Operation.....	198
7.3: Profile Torque Mode Operation.....	199
7.4: Profile Mode Objects.....	200

7.1: Profile Position Mode Operation

Point-to-Point Motion Profiles

In profile position mode, an amplifier receives set points from the trajectory generator to define a target position and moves the axis to that position at a specified velocity and acceleration. This is known as a point-to-point move.

The amplifier performs profile position moves in Profile Position Mode ([Mode Of Operation](#) [index 0x6060, p. 64] =1).

Jerk

In a point-to-point move, the rate of change in acceleration is known as jerk. In some applications, high rates of jerk can cause excessive mechanical wear or material damage.

Trapezoidal and S-curve Motion Profiles

To support varying levels of jerk tolerance, the profile position mode supports two motion profiles: the trapezoidal profile, which has unlimited jerk, and the jerk-limited S-curve (sinusoidal) profile.

In a trapezoidal profile, jerk is unlimited at the corners of the profile (start of the move, when the target velocity is reached, when deceleration begins, and at the end of the move). S-curve profiling limits jerk or “smooths” the motion.

Note that an S-curve profile move does not support an independent deceleration rate. Instead, the acceleration rate is applied to both the acceleration and deceleration of the move. Further, trapezoidal and profile position special velocity mode profiles support changing of the parameters of the current move, whereas an S-curve profile does not. This difference is discussed in [Handling a Series of Point-to-Point Moves](#), p. 191.

The [Motion Profile Type](#) object (index 0x6086, p. 204) controls which type of profile is used.

For guidance in choosing a trapezoidal or S-curve profile, read the following sections and then refer to [Trapezoidal vs. S-Curve Profile: Some Design Considerations](#), p. 197.

(Copley Controls CANopen amplifiers also support a profile position special velocity mode. This profile type resembles the trapezoidal profile, but with no target position specified. The motion obeys the acceleration, deceleration, and velocity limits, but continues to move as though the target position were infinite.)

Relative vs. Absolute Moves

In a relative move, the target position is added to the instantaneous commanded position, and the result is the destination of the move. In an absolute move, the target position is offset from the home position.

Handling a Series of Point-to-Point Moves

There are two methods for handling a series of point-to-point moves:

- As a series of discrete profiles (supported in both trapezoidal and S-curve profile moves)
- As one continuous profile (supported in trapezoidal profile moves only)

General descriptions of the two methods follow. Detailed procedures and examples appear later in the chapter.

A Series of Discrete Profiles

The simplest way to handle a series of point-to-point moves is to start a move to a particular position, wait for the move to finish, and then start the next move. As shown below, each move is discrete. The motor accelerates, runs at target velocity, and then decelerates to zero before the next move begins.

The *CANopen Profile for Drives and Motion Control (DSP 402)* refers to this method as the “single setpoint” method.

Copley Controls CANopen amplifiers allow use of this method with both trapezoidal and S-curve profile moves.

One Continuous Profile

Alternately, a series of trapezoidal profile moves can be treated as a continuous move. As shown below, the motor does not stop between moves. Instead, the move parameters (target position, velocity, acceleration, and deceleration) are updated immediately at the end of the previous move (when bit 4 of the [Control Word](#) is set, as described later in this section).

The *CANopen Profile for Drives and Motion Control (DSP 402)* refers to this method as the “set of setpoints” method.

Copley Controls CANopen amplifiers allow use of this method with trapezoidal profile moves only.

Overview of Point-to-Point Move Parameters and Related Data

Move Parameters

Each point-to-point move is controlled by a set of parameters, accessed through the following objects.

Object Name/ID	Description	Page #
Trajectory Jerk Limit / 0x2121	Maximum rate of change of acceleration. Used with S-curve profiles only.	201
Target Position / 0x607A	When running in position profile mode, this object holds the destination position of the trajectory generator. Note that for profile position special velocity mode profiles, the target position only specifies the direction of motion, not a true position.	201
Profile Velocity / 0x6081	Velocity that the trajectory generator will attempt to achieve when running in position profile mode.	202
Profile Acceleration / 0x6083	Acceleration that the trajectory generator attempts to achieve when running in position profile mode.	203
Profile Deceleration / 0x6084	Note that an S-curve profile move does not use a deceleration rate. Instead, the acceleration rate is applied to both the acceleration and deceleration of the move.	203
Quick Stop Deceleration / 0x6085	Deceleration value used when a trajectory needs to be stopped as the result of a quick stop command. Note that unlike most trajectory configuration values, this value is NOT buffered. Therefore, if the value of this object is updated during an abort, the new value is used immediately.	204
Motion Profile Type / 0x6086	Trapezoidal, S-curve, or special velocity mode.	204

The Point-to-Point Move Buffer

In profile position mode, the amplifier uses a buffer to store the parameters (listed in [Move Parameters](#), above) for the next point-to-point move, or for a modification of the current trapezoidal profile move. The move buffer can be modified at any point before a control sequence (described in following sections) copies the “next-move” parameters to the active move registers.

Move-Related Control Word and Status Word Bit Settings

An amplifier's **Control Word** (index 0x6040) and **Status Word** (index 0x6041) play an important role in the initiation and control of point-to-point move sequences, as described below.

Object Name / Index	Bit #	Bit Name	Description/Comments
Control Word / 0x6040	4	new setpoint	The transition of bit 4 from 0 to 1 is what causes the amplifier to copy a set of move parameters from the buffer to the active register, thus starting the next move.
	5	change set immediately	Allows or prevents attempt to perform a series of moves as one continuous profile (change move parameters while move is in progress). Value = 0: Amplifier will ignore a 0 to 1 transition on bit 4 if there is currently a move in progress. Value = 1 and Motion Profile Type (index 0x6086, p. 204) = trapezoidal or velocity mode: Allow new move to begin immediately after bit 4 low-to-high transition. Value = 1 and Motion Profile Type is S-curve: Ignore update and continue move with old parameters.
	6	absolute/relative	Value = 0: Move is absolute (based on home position). Value = 1: Move is relative (based on current commanded position).
	8	halt	Value = 1: Interrupts the motion of the drive. Wait for release to continue.
Status Word / 0x6041	10	target reached	Amplifier sets bit 10 to 1 when target position has been reached. Amplifier clears bit 10 to zero when new target is received. If quick stop option code (p. 63) is 5, 6, 7, or 8, this bit is set when the quick stop operation is finished and the drive is halted. Bit 10 is also set when a Halt occurs.
	12	setpoint acknowledge	Set by the amplifier when Control Word bit 4 goes from 0 to 1. Cleared when Control Word bit 4 is cleared. An invalid transition on Control Word bit 4 will not cause this bit to be set. Invalid transitions include those made while drive is in motion and in S-curve mode, or made while drive in motion with Control Word bit 5 not set.

Point-To-Point Move Sequence Examples

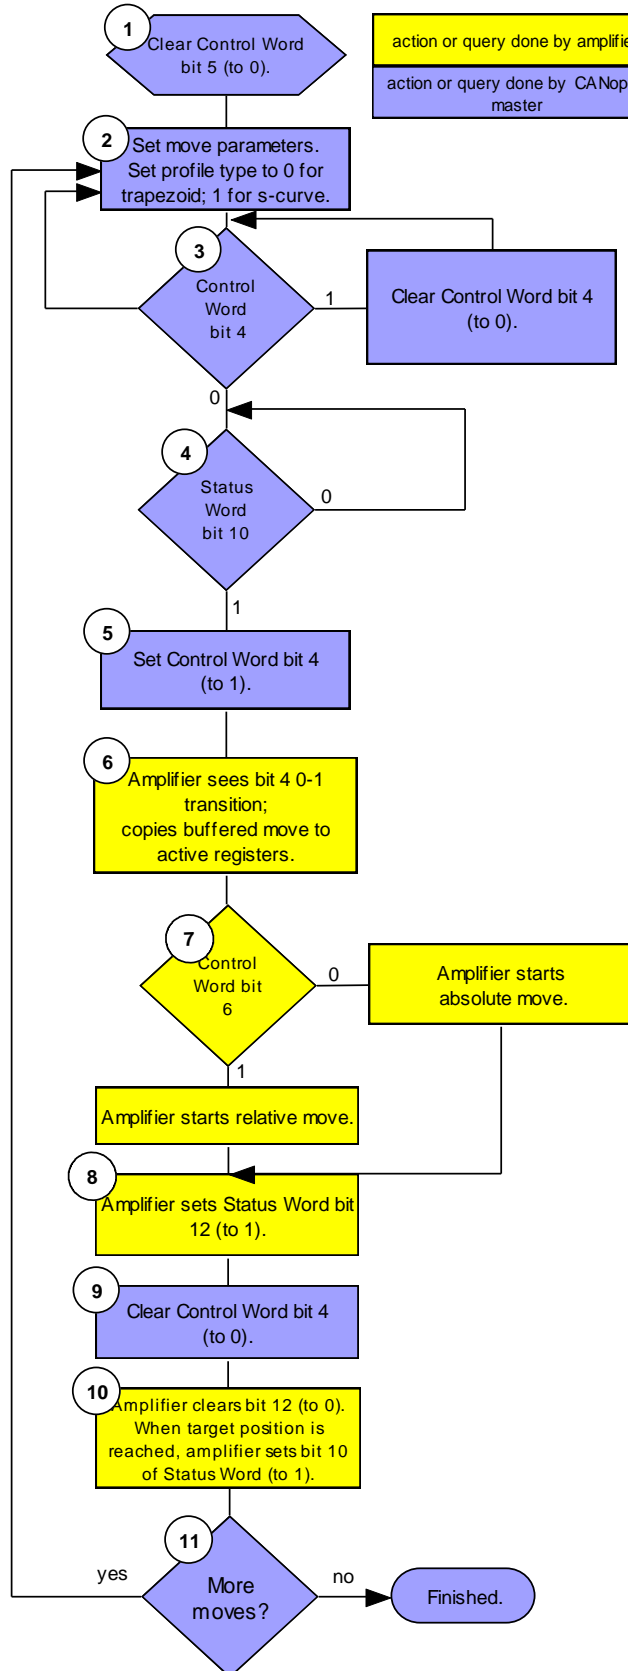

Overview

The following sections illustrate how to perform:

- A series of moves treated as a [Series of Discrete Profiles](#)
- A series of trapezoidal or profile position special velocity moves treated as [One Continuous Profile](#)

Series of Discrete Profiles

This diagram illustrates how to implement a series of moves as a series of discrete profiles.

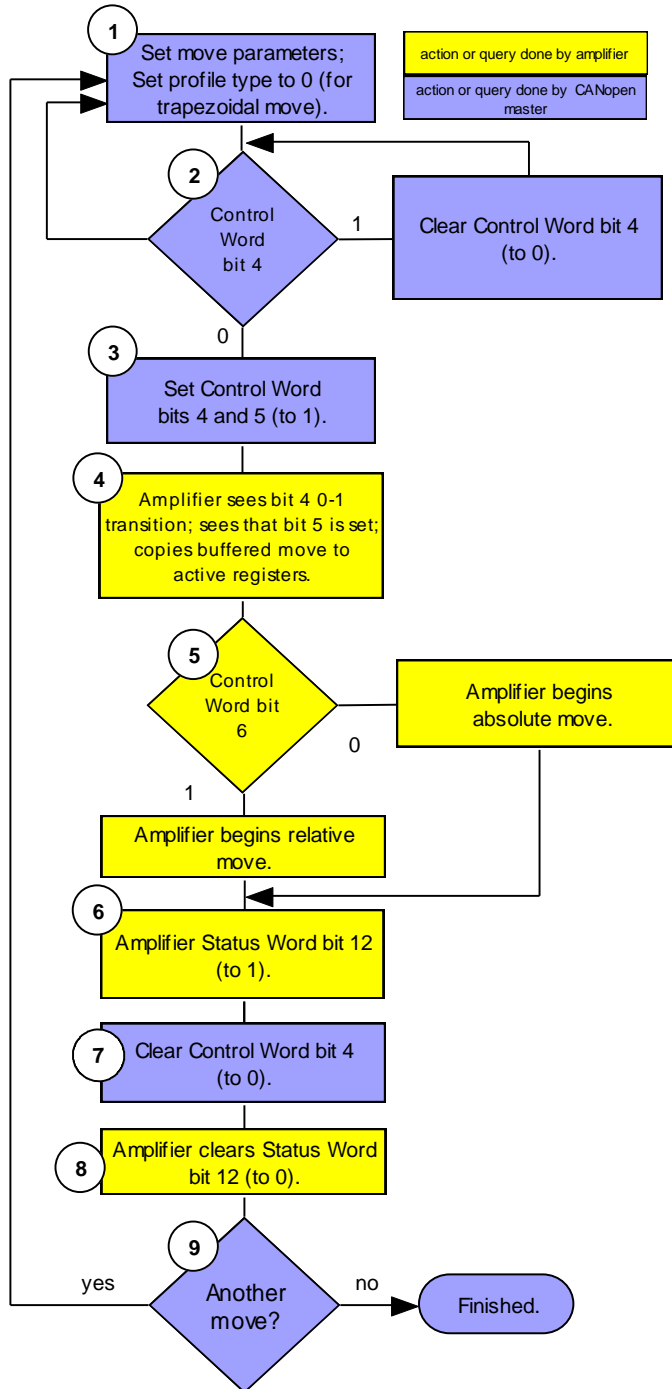

Notes:

- Control Word bit 5 is "change set immediately." Clearing it tells the amplifier to treat a series of moves as a series of discrete profiles.
 - Move Parameters are described on page 188.
 - Control Word bit 4 is "new setpoint." It needs to be 0 because the move is triggered by a 0->1 transition.
 - Status Word bit 10 is "target reached." Value is 0 when move is in progress; 1 when move is finished.
 - Value of 1 indicates that valid data has been sent to amplifier and new move should begin.
 - Amplifier must detect 0-1 transition to begin move.
 - Control word bit 6: value 0 causes absolute move; value 1 causes relative move.
 - Status Word bit 13 is "setpoint acknowledge." A value of 1 indicates the amplifier has received a setpoint and has started the move.
 - Control Word bit 4 is "new setpoint." It needs to be 0 to allow the next move is triggered by a 0->1 transition. Also, the 1->0 transition causes the amplifier to clear bit 13.
 - Amplifier detects 0->1 transition of Control Word bit 4 and clears bit 13 in response.
- When the motor reaches the target position, the amplifier sets Status Word bit 10 ("target reached") to 1.
11. CANopen master returns to step 2 if there are more moves to complete; otherwise, the series of moves is finished.

One Continuous Profile

This diagram illustrates how to implement a series of moves as one continuous profile.

Notes:

1. Move Parameters are described on page 188. This type of move is only supported as a trapezoidal profile.

2. Control Word bit 4 is "new setpoint." It needs to be 0 because the move will be triggered by a 0->1 transition.

3. Bit 4, value of 1 indicates that valid data has been sent to amplifier and new move should begin.

Bit 5 is "change set immediately." A value of 1 tells the amplifier to update the current profile immediately by copying the contents of the move buffer to the active registers (without waiting for move to finish).

4. Amplifier must detect bit 4 0-1 transition to begin move. Bit 5 value 1 allows immediate update.

5. Control word bit 6: value 0 causes absolute move; value 1 causes relative move.

6. Status Word bit 13 is "setpoint acknowledge." A value of 1 indicates the amplifier has received a setpoint and has started the move.

7. Control Word bit 4 is "new setpoint." It needs to be 0 to allow the next move will be triggered by a 0->1 transition. Also, the 1->0 transition causes the amplifier to clear bit 13.

8. Amplifier detects 0->1 transition of Control Word bit 4 and clears bit 13 in response.

When the motor reaches the target position, the amplifier sets Status Word bit 10 ("target reached") to 1.

9. CANopen master returns to step 1 if there are more moves to complete; otherwise, the series of moves is finished.

Trapezoidal vs. S-Curve Profile: Some Design Considerations

Difference Between Trapezoidal and S-Curve Profiles

Here is a review of the differences between trajectory and S-curve profiles, and some design considerations indicated by those differences:

Trapezoidal Profile	S-Curve Profile	Design Considerations
Unlimited jerk, operation not as smooth.	Limited jerk, smoother operation.	If the application cannot tolerate jerk, use S-curve. If the application can tolerate jerk, other features available exclusively in trapezoidal profile may indicate its use.
Supports separate acceleration and deceleration rates.	Does not support separate deceleration rate; uses acceleration rate for acceleration and deceleration.	If a separate deceleration rate is critical, the trapezoidal profile is indicated.
Supports modification of current move parameters during current move, allowing the execution of a series of moves as a continuous profile.	Does not support modification of current move. A series of moves requires a series of discrete profiles.	If current move modification is critical, the trapezoidal profile is indicated.
Generally requires less torque than the S-curve profile to complete an equal move in equal time.	Generally requires more torque than a trapezoidal profile to complete an equal move in equal time, to make up for time sacrificed for gentler starts and stops.	Designers switching a profile from trapezoidal to S-curve or lowering the value of Trajectory Jerk Limit (index 0x2121 , p. 201) might notice some slowing. A higher Profile Acceleration can be applied to compensate, but watch out for amplifier and motor limits.

7.2: Profile Velocity Mode Operation

Position and Velocity Loops

In profile velocity mode, both the velocity and position loops are used to reach the velocity programmed in the [Target Velocity](#) object (index [0x60FF](#), p. 202). Profile velocity moves are controlled by some of the same gains and limits objects used in profile position mode.

The amplifier performs profile velocity moves in Profile Velocity Mode ([Mode Of Operation](#) [index [0x6060](#), p. 64] =3).

Stepper Motor Support

The profile velocity mode can be used with a stepper motor.

Encoder Used as Velocity Sensor

The actual velocity is not measured with a velocity sensor. It is derived using position feedback from the encoder.

Starting and Stopping Profile Velocity Moves

As in Profile Position (and Interpolated Position) modes, motion is started by a low-to-high transition of bit 4 of the [Control Word](#) (index [0x6040](#), p. 58). Motion is stopped by a high-to-low transition of the same bit.

Profile Velocity Mode vs. Profile Position Special Velocity Mode

Profile Position Special Velocity Mode

As described earlier, the profile position mode supports a special velocity mode, in which the velocity trajectory generator takes the place of the trapezoidal generator. The two generators are identical with the exception that in the velocity trajectory generator, the [Target Position](#) object (index [0x607A](#), p. 201) indicates direction, not a target position. Any positive number (including zero) gives positive motion and any negative number gives negative motion. In this special velocity mode, the move continues at the [Profile Velocity](#) (index [0x6081](#), p. 202) until a new target velocity is set or until the move is halted.

To start a move in this mode, program all the profile parameters (trajectory mode, profile velocity, acceleration, deceleration, and direction) and then program a 0-to-1 transition on [Control Word](#) bit 4. You can then clear bit 4 without effecting the trajectory, modify any of the parameters (direction, velocity, acceleration, etc), and set [Control Word](#) bit 4 (with bit 5 set also) to update the profile. The normal way to stop motion in this mode is to set a profile velocity of 0.

Profile Velocity Mode

In profile velocity mode, the target velocity is updated as soon as the [Target Velocity](#) object (index [0x60FF](#), p. 202) is set.

In this mode, [Control Word](#) bits 4, 5, and 6 are not used.

To start a move in profile velocity mode, set the profile parameters (profile acceleration, profile deceleration, and target velocity). The amplifier will generate a move as long as the halt bit ([Control Word](#) bit 8) is not set. If the halt bit is set, the amplifier will stop the move using the deceleration value.

7.3: Profile Torque Mode Operation

Current Loop

In profile torque mode, the current loop is used to reach the torque programmed in the [Target Torque](#) object (index [0x6071](#), p.202). When the amplifier is enabled, or the torque command is changed, the motor torque ramps to the new value at the rate programmed in [Torque Slope](#) (index [0x6087](#), p. 203). When the amplifier is halted, the torque ramps down at the same rate.

Profile torque moves are controlled by (index [0x2380](#), p. 152).

The amplifier performs profile torque moves in Profile Torque Mode ([Mode Of Operation](#) [index [0x6060](#), p. 64] =4).

Notes:

- 1: The profile torque mode cannot be used with a stepper motor.
- 2: To convert torque commands to the current commands that actually drive the motor, the amplifier performs calculations based on the motor's [Motor Torque Constant](#) (Index [0x2383](#), Sub-Index 12, p. 93) and [Motor Continuous Torque](#) (Index [0x2383](#), Sub-Index 14

Starting and Stopping Profile Torque Moves

To start a move in profile torque mode, set the profile parameters. The amplifier will generate a move as long as the halt bit ([Control Word](#) bit 8) is not set. If the halt bit is set, the amplifier will stop the move using the torque_slope value.

7.4: Profile Mode Objects

Contents of this Section

This section describes the objects that control operation of the amplifier in profile position, velocity, and torque modes.

They include:

Trajectory Jerk Limit	Index 0x2121	201
Trajectory Generator Status	Index 0x2252	201
Trajectory Generator Destination Position	Index 0x2122	201
Target Position	Index 0x607A	201
Profile Velocity	Index 0x6081	202
Target Velocity	Index 0x60FF	202
Target Torque	Index 0x6071	202
Torque Command	Index 0x6074	202
Motor Rated Torque	Index 0x6076	202
Torque Actual Value	Index 0x6077	202
Torque Slope	Index 0x6087	203
Torque Profile Type	Index 0x6088	203
Profile Acceleration	Index 0x6083	203
Profile Deceleration	Index 0x6084	203
Quick Stop Deceleration	Index 0x6085	204
Motion Profile Type	Index 0x6086	204
Velocity Sensor Selection	Index 0x606A	204

TRAJECTORY JERK LIMIT**INDEX 0x2121**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	100 counts / sec ³	0 – 100,000,000	YES	RF

Description

This object defines the maximum jerk (rate of change of acceleration) for use with S-curve profile moves. Other profile types do not use the jerk limit.

TRAJECTORY GENERATOR STATUS**INDEX 0x2252**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	See <i>Description</i> , below.	YES	-

Description

This variable gives status information about the trajectory generator. It is bit-mapped as follows:

Bit	Description
0-10	Reserved for future use.
11	Homing error. If set an error occurred in the last home attempt. Cleared by a home command.
12	Referenced. Set if a homing command has been successfully executed. Cleared by a home command.
13	Homing. Set when the amplifier is running a home command.
14	Set when a move is aborted. This bit is cleared at the start of the next move.
15	In motion bit. If set, the trajectory generator is presently generating a profile.

TRAJECTORY GENERATOR DESTINATION POSITION**INDEX 0x2122**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RO	counts	-	YES	-

Description

The position that the trajectory generator uses as its destination. Mostly useful when driving the amplifier using the pulse & direction inputs.

TARGET POSITION**INDEX 0x607A**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	counts	-	YES	RF

Description

When running in position profile mode, this object defines the destination of the trajectory generator.

The object's meaning varies with the move type, as set in [Motion Profile Type](#) (index [0x6086](#), p. [204](#)):

Move Type	Meaning
Relative	Move distance.
Absolute	Target position.
Velocity	Direction: 1 for positive, -1 for negative.

Note that the target position programmed here is not passed to the internal trajectory generator until the move has been started or updated using the [Control Word](#). See [Profile Position Mode Operation](#), p. [190](#), for more information.

PROFILE VELOCITY**INDEX 0x6081**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	0 – 500,000,000	YES	RF

Description

In profile position mode, this value is the velocity that the trajectory generator will attempt to achieve.

Note that the value programmed here is not passed to the internal trajectory generator until the move has been started or updated using the [Control Word](#). See [Profile Position Mode Operation](#), p. 190, for more information.

TARGET VELOCITY**INDEX 0x60FF**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	-500,000,000 - 500,000,000	YES	R

Description

In profile velocity mode, this object is an input to the amplifier's internal trajectory generator. Any change to the target velocity triggers an immediate update to the trajectory generator.

Note that this is different from the way the profile position works. In that mode, changing the trajectory input parameters doesn't affect the trajectory generator until bit 4 of the [Control Word](#) object (index 0x6040, p. 58) has been changed from 0 to 1.

TARGET TORQUE**INDEX 0x6071**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	rated torque/1000	-32,768 - 32,767	YES	RF

Description

In profile torque mode, this object is an input to the amplifier's internal trajectory generator. Any change to the target torque triggers an immediate update to the trajectory generator.

TORQUE COMMAND**INDEX 0x6074**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	rated torque/1000	-32,768 - 32,767	YES	RF

Description

Output value of the torque limiting function.

MOTOR RATED TORQUE**INDEX 0x6076**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.001 Nm	0 - 32,767	YES	RF

Description

Motor's rated torque (see motor name plate or documentation).

TORQUE ACTUAL VALUE**INDEX 0x6077**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	rated torque/1000	-32,768 - 32,767	YES	RF

Description

Instantaneous torque in the motor.

TORQUE SLOPE**INDEX 0x6087**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	rated torque/1000/second	Positive integer values	YES	RF

Description

Torque acceleration or deceleration.

TORQUE PROFILE TYPE**INDEX 0x6088**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	--	0-0	YES	RF

Description

Type of torque profile used to perform a torque change. Set to zero to select trapezoidal profile.

PROFILE ACCELERATION**INDEX 0x6083**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	10 counts/sec ²	0 - 200,000,000	YES	RF

Description

In profile position mode, this value is the acceleration that the trajectory generator attempts to achieve. For S-curve moves, this value is also used to decelerate at the end of the move.

Note that the value programmed here is not passed to the internal trajectory generator until the move has been started or updated using the [Control Word](#). See [Profile Position Mode Operation](#), p. 190, for more information.

PROFILE DECELERATION**INDEX 0x6084**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	10 counts/sec ²	0 - 200,000,000	YES	RF

Description

Deceleration that the trajectory generator uses at the end of a trapezoidal profile when running in position profile mode.

Note that this value is only used when running trapezoidal or profile position special velocity mode profiles. The S-curve profile generator uses the [Profile Acceleration](#) object (index 0x6083, p. 203) as the acceleration target for both the start and end of moves.

Note that the value programmed here is not passed to the internal trajectory generator until the move has been started or updated using the [Control Word](#). See [Profile Position Mode Operation](#), p. 190, for more information.

QUICK STOP DECELERATION**INDEX 0x6085**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	10 counts/sec ²	0 - 200,000,000	YES	RF

Description

Also known as Trajectory Abort Deceleration. This object gives the deceleration value used when a trajectory needs to be stopped as the result of a quick stop command.

When a quick stop command is issued, the command velocity is decreased by this value until it reaches zero. This occurs in all position modes (homing, profile position, and interpolated position modes), and for all trajectory generators (trapezoidal and S-curve).

Note that unlike most trajectory configuration values, this value is NOT buffered. Therefore, if the value of this object is updated during an abort, the new value is used immediately.

Also note that setting this object to zero causes the abort to run with unlimited deceleration. The command velocity is immediately set to zero.

MOTION PROFILE TYPE**INDEX 0x6086**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See <i>Description</i> , below.	YES	RF

Description

This object selects the type of trajectory profile to use when running in profile position mode. The supported values for this object are:

Mode	Description
0	Trapezoidal profile mode.
3	S-curve profile mode (Jerk limited).
-1	Velocity mode.

The amplifier will not accept other values. See [Profile Position Mode Operation](#), p. 190, for more information.

Note that the value programmed here is not passed to the internal trajectory generator until the move has been started or updated using the [Control Word](#). See [Profile Position Mode Operation](#), p. 190, for more information.

VELOCITY SENSOR SELECTION**INDEX 0x606A**

Type	Access	Units	Range	Map PDO	Memory
See description	RW	-	0	YES	RF

Description

This object specifies how actual velocity is measured. Currently, Copley Controls drives support only the use of position encoders for calculation of actual velocity. This should be set to zero. Any value other than zero will return an error.

CHAPTER

8: INTERPOLATED POSITION OPERATION

This chapter describes control of an amplifier in interpolated position mode.

Contents include:

8.1: Interpolated Position Mode Overview	206
8.2: Interpolated Position Mode Objects	212

8.1: Interpolated Position Mode Overview

Contents of this Section

This section provides an overview of the interpolated position mode.

Topics include:

Coordinated Motion.....	207
CANopen Standard IP Move Objects	208
Copley Controls Alternative Objects for IP Moves	208
Interpolated Position Trajectory Buffer.....	209
Starting an Interpolated Position Move	210
Ending an Interpolated Position Move	210
Synchronization.....	210
PVT Profile Moves Using the Copley Controls Alternative Objects	211

Coordinated Motion

Interpolated position mode is used to control multiple coordinated axes or a single axis with the need for time-interpolation of setpoint data. In interpolated position mode, the trajectory is calculated by the CANopen master and passed to the amplifier's interpolated position buffer as a set of points. The amplifier reads the points from the buffer and performs linear or cubic interpolation between them.

Copley Controls CANopen amplifiers support three interpolation sub-modes: linear interpolation with constant time, linear interpolation with variable time, and cubic polynomial interpolation, which is also known as position, velocity, and time (PVT) interpolation. The amplifier can switch between linear and PVT interpolation on the fly.

Linear Interpolation with a Constant Time

In this mode, trajectory position points are assumed to be spaced at a fixed time interval. The amplifier drives the axis smoothly between two points within the fixed time.

Linear Interpolation with Variable Time

In this linear interpolation mode, each trajectory segment can have a different time interval.

Cubic Polynomial (PVT) Interpolation

In PVT mode, the CANopen master describes the trajectory points as a position, velocity, and time until the next point.

Given two such points, the amplifier can interpolate smoothly between them by calculating a cubic polynomial function, and evaluating it repeatedly until the next point is encountered.

Cubic polynomial interpolation produces much smoother curves than linear interpolation. Thus it can describe a complex profile with many fewer reference points. This allows a profile to be compressed into a small number of reference points which can be sent over the CAN bus using only a small amount of its total bandwidth.

Standard and Copley Custom Objects for Interpolated Position Mode

Copley Controls CANopen amplifiers provide two sets of objects for performing IP moves:

- The CANopen DSP-402 profile standard IP move objects: 0x60C0, 0x60C1, and 0x60C2.
- The Copley Controls alternative objects for PVT and linear interpolation with variable time: 0x 2010, 0x 2011, 0x 2012, and 0x 2013. These objects use bandwidth in a more efficient manner, and feature an integrity counter to identify lost packets.

CANopen Standard IP Move Objects

When the CANopen DSP-402 profile standard IP move objects are used, the interpolation submode is chosen by setting a code in [Interpolation Submode Select](#) (index 0x60C0 p. 215) as described here:

IP Submode	Description
0	Linear interpolation with a constant time.
-1	Linear interpolation with variable time.
-2	PVT interpolation.

Linear Interpolation with a Constant Time

In IP submode 0, the trajectory target position of each segment is written to [Interpolation Position Target](#) (index 0x60C1, Sub-Index 1, p. 216). Each time [Interpolation Position Target](#) is written to, the entire record is written to the amplifier's internal buffers. (In mode 0, Sub-Index 2 and Sub-Index 3 are ignored).

The time interval is set in [Interpolation Constant Time](#) Index (index 0x60C2, Sub-Index 1, p. 217).

Linear Interpolation with Variable Time

In IP submode -1, each trajectory segment can have a different time interval. The trajectory target position of each segment is written to [Interpolation Position Target](#), which is Sub-Index 1 of the [Interpolation Data Record](#) (index 0x60C1, p. 216). With each update to [Interpolation Time](#) (index 0x60C1, Sub-Index 2, p. 216), the entire record is written to the amplifier's internal buffers. (In mode -1, Sub-Index 3 is ignored.)

Cubic Polynomial (PVT) Interpolation

In IP submode -2, the trajectory target position of each segment is written to [Interpolation Position Target](#) (index 0x60C1, Sub-Index 1, p. 216) and the segment time is written to [Interpolation Time](#) (index 0x60C1, Sub-Index 2). When the segment velocity is written to [Interpolation Velocity](#) (index 0x60C1, Sub-Index 3, p. 216), the entire record is written to the amplifier's internal buffers.

Copley Controls Alternative Objects for IP Moves

The Copley Controls alternative objects use bandwidth in a highly efficient manner. They also feature an integrity counter to identify lost packets.

Each profile segment is packed into a single 8-byte object in the object dictionary ([IP move segment](#) command, index 0x2010, p. 213). If a PDO is used to transmit the object, then a segment may be transmitted in a single CAN message.

For a PVT example, see [PVT Profile Moves Using the Copley Controls Alternative Objects](#), p. 211.

Interpolated Position Trajectory Buffer

A typical profile contains a large number of segments. These segments must be passed to the amplifier over the CANopen network quickly enough to ensure that the next point is received before the amplifier needs it to calculate the intermediate motor positions.

To reduce the tight timing requirements of sending trajectory segments over the network, the amplifier maintains a buffer of trajectory segments in its memory. This allows the controller to send trajectory segments in bursts, rather than one at a time, as the profile is executing. The amplifier can hold 32 trajectory segments. See the [Trajectory Buffer Free Count](#) object (index 0x2011, p. 214).

Guidelines for Buffer Use

The amplifier needs a minimum of 2 trajectory segments to perform interpolation. Thus, a successful move requires at least two segments in the buffer. Generally, it is best to keep the buffer at least one step ahead of the interpolation, so it is best to keep at least three segments in the buffer at any time during a move.

For instance, suppose a PVT trajectory includes the three segments:

P0, V0, T0
P1, V1, T1
P2, V2, T2

While the move is between the points P0 and P1, the amplifier needs access to both of these segments to do the interpolation. When that segment is finished (at point P1) the amplifier needs the next segment in order to continue interpolating toward point P2.

So, between P0 and P1, the amplifier does not yet need P2. At P1, the amplifier no longer needs P0, but does need P2 to continue. Strictly speaking, there is no time when the amplifier needs all three segments at once. However, in practice it is best to make sure that P2 is available when the move is getting close to it.

Starting an Interpolated Position Move

An interpolated position move is started using [Control Word](#) settings (index [0x6040](#), p. 58) and [Status Word](#) settings (index [0x6041](#), p. 58) settings. The transition of [Control Word](#) bit 4 from 0 to 1 causes the amplifier to start the move using the points stored in the interpolated move trajectory buffer. For an example, see [PVT Profile Moves Using the Copley Controls Alternative Objects](#) (below) and [Format of Data Bytes in PVT Segment Mode](#), p. 214.

Ending an Interpolated Position Move

Interpolated position moves can be stopped by adding a zero time value to the buffer. This method allows the amplifier to reach the present set point before motion stops.

When using the CANopen standard interpolation objects, send the zero time value using one the methods described below.

IP Submode	Description	Method
0	Linear interpolation with a constant time.	Send a zero value to Interpolation Constant Time Index (index 0x60C2 , Sub-Index 1, p. 217) before sending a segment to the buffer.
-1	Linear interpolation with variable time.	Send a zero in Interpolation Time (index 0x60C1 , Sub-Index 2, p. 216).
-2	PVT move using standard CANopen objects.	

Sending a segment with a zero time value is the recommended way to end an interpolation profile that uses the Copley Controls alternate objects. See [IP move segment](#) command object (index [0x2010](#), p. 213), and [Format of Data Bytes in PVT Segment Mode](#), p. 214.

An Interpolated position move can also be ended in one of several other ways:

- Clear bit 4 of the [Control Word](#) (index [0x6040](#), p. 58).
- Clear the quick stop bit (bit 2) of the [Control Word](#).
- Set the halt bit (bit 8) of the [Control Word](#).
- Stop adding segments to the buffer. This will cause a buffer underflow, stopping interpolation.

Note that each of these methods stops motion immediately, even if the axis has not reached the set point.

Synchronization

An amplifier can run in synchronized mode or asynchronous mode. Synchronized mode should be used when doing multi-axis interpolated position moves. (See [PDO Transmission Modes](#), p. 25, and [SYNC and High-resolution Time Stamp Messages](#), p. 42.)

PVT Profile Moves Using the Copley Controls Alternative Objects

As mentioned earlier, Copley Controls CANopen amplifiers provide an alternate set of objects for more efficient execution of PVT moves and linear interpolation moves with variable time.

The basic method for sending PVT profile data over the CANopen network is:

- 1 Configure a transmit PDO to send out the [Trajectory Buffer Status](#) object (index [0x2012](#), p. [215](#)). The preferred transmit type for this PDO is 255 (event driven). This causes the PDO to be transmitted every time a segment is read from the buffer, or on error.
- 2 Configure a receive PDO to receive the PVT buffer data via the [IP move segment](#) command (index [0x2010](#), p. [213](#)).
- 3 Use either PDO or SDO transfers to fill the PVT buffer with the first N points of the profile (where N is the size of the PVT buffer).
- 4 If using synchronization, start synchronization before starting motion.
- 5 Start the move by causing a 0-to-1 transition of bit 4 of the [Control Word](#) object (index [0x6040](#), p. [58](#)).
- 6 Each time a new [Trajectory Buffer Status](#) object (index [0x2012](#), p. [215](#)) is received, first check for error bits. If no errors have occurred, then one or more additional segments of PVT data should be transmitted (until the trajectory has finished).
 - If the [Trajectory Buffer Status](#) object indicates that an error has occurred, then the reaction of the controller will depend on the type of error:
 - Underflow errors indicate that the master controller is not able to keep up with the trajectory information. When an amplifier detects a buffer underflow condition while executing an interpolated profile, it will immediately abort the profile. In this case, using longer times between segments is advisable.
 - Overflow errors indicate an error in the CANopen master software.
 - Segment sequencing errors suggest either an error in the CANopen master software or a lost message, possibly due to noise on the bus. Since the next segment identifier value is passed with the PVT status object, it should be possible to resend the missing segments starting with the next expected segment. Note that the sequencing error code must be cleared with the appropriate [IP move segment](#) command [Buffer Command Mode](#) message (p. [213](#)) before any new segments of PVT data are accepted.
- 7 End the move by setting the PVT segment time to zero. See [IP move segment](#) command object (index [0x2010](#), p. [213](#)), and [Format of Data Bytes in PVT Segment Mode](#), p. [214](#).

8.2: Interpolated Position Mode Objects

Contents of this Section

This section describes the objects that control operation of the amplifier in profile position mode.

They include:

IP move segment command	Index 0x2010.....	213
Trajectory Buffer Free Count	Index 0x2011	214
Trajectory Buffer Status	Index 0x2012	215
Next Trajectory Segment ID	Index 0x2013	215
Interpolation Submode Select	Index 0x60C0	215
Interpolation Data Record	Index 0x60C1	216
Interpolation Position Target	Index 0x60C1, Sub-Index 1	216
Interpolation Time	Index 0x60C1, Sub-Index 2	216
Interpolation Velocity	Index 0x60C1, Sub-Index 3	216
Interpolation Constant Time	Index 0x60C2	217
Interpolation Constant Time Index	Index 0x60C2, Sub-Index 1	217
Interpolation Constant Time Units	Index 0x60C2, Sub-Index 2	217

IP MOVE SEGMENT COMMAND**INDEX 0x2010**

Type	Access	Units	Range	Map PDO	Memory
8 Byte array	RW	-	-	YES	R

Overview

This object is used to send PVT segment data and buffer control commands in interpolated position mode. This object is write only.

Byte 1: Header Byte

The first byte of the object identifies the type of information contained in the rest of the message. Among other things, it determines whether the PVT Segment Command object operates in a PVT buffer command mode or carries a PVT profile segment.

Buffer Command Mode

If the most significant bit of the header byte is set to 1, then the PVT segment command object is a PVT buffer command. In this case, the command code is located in the remaining 7 bits of the header byte and should take one of the following codes:

Code Description

- | | |
|---|---|
| 0 | Clear the buffer and abort any move in progress. |
| 1 | Pop the N most recently sent segments off the buffer. PVT profiles will continue to run as long as the buffer doesn't underflow. The number of segments to pop (N) is passed in the next byte (byte 1 of the message).
If there are less than N segments on the buffer, this acts the same as a buffer clear except that the profile is not stopped except by underflow. |
| 2 | Clear buffer errors. The next byte of data gives a mask of the errors to be cleared (any set bit clears the corresponding error). Error bit locations are the same as the top byte of the status value. |
| 3 | Reset the segment ID code to zero. |
| 4 | No operation. Used with EtherCAT |

PVT Segment Mode

If the most significant bit of the first byte of the message is a zero, then the message contains a segment of the PVT profile. The remaining bits of this first byte contain the following values:

Bits Description

- | | |
|-----|--|
| 0-2 | Segment integrity counter. This three-bit value increases for each segment sent and is used by the amplifier to identify missing profile segments. More details of the use of this value are provided below. |
| 3-6 | These bits hold a buffer format code. This code identifies how the PVT data is packed into the remaining 7 bytes of the message. See the table below for details. |
| 7 | Zero. This bit is always zero identifying the message as containing PVT data. |

Format of Data Bytes in PVT Segment Mode

Buffer segments hold the PVT information to be added to the buffer. The PVT data is stored in the remaining 7 bytes of the message. The format of this data is indicated by the buffer format code encoded in byte 0.

Code Description

0	Bytes	Contents
1		The time (in milliseconds) until the start of the next PVT segment. Set to zero to end the move.
2-4		A 24-bit absolute position (counts). This is the starting position for this profile segment.
5-7		A 24-bit velocity given in 0.1 counts / second units.
1		Same as for code 0, except velocity is in 10 ct/sec units. This allows greater velocity range with less precision.
2		Same as for code 0, except the position is relative to the previous segment's position. If this is the first segment of a move, the position is relative to the starting commanded position.
3		Same as for code 2, except velocity is in 10 ct/sec units.
4		Bytes 1-4 hold a 32-bit absolute position (counts). This is not a full segment itself, but is useful at the start of a move when a full 32-bit position must be specified. If the next segment is a relative position segment (code 2 or 3), its position is relative to this value.
5	Bytes	Contents
1		The time (in milliseconds) until the start of the next linear IP segment. Set to zero to end the move.
2-5		A 32-bit absolute position (counts). This is the starting position for this profile segment.
6		Same as for code 5, except the position is relative to the previous segment's position. If this is the first segment of a move, the position is relative to the starting commanded position.
7-15		Reserved for future use.

Segment Integrity Counter

Each segment of a move is given a 16-bit numeric identifier. The first segment is given the identifier 0, and each subsequent segment is given the next higher ID.

The three-bit integrity counter sent in byte zero of the segment should correspond to the lowest three bits of the ID code (i.e. zero for the first segment and increasing by 1 for each subsequent segment). If the amplifier receives non-consecutive segments, an error is flagged and no further segments are accepted until the error is cleared. This allows the amplifier to identify missing segments in the move and stop processing data at that point. Because the PVT buffer status message includes the ID of the next expected segment, it should be possible to clear this error and resend the missing data before the buffer is exhausted.

TRAJECTORY BUFFER FREE COUNT

INDEX 0x2011

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	-	-	YES	-

Description

This object gives the number of locations in the IP trajectory buffer that are currently available to accept new trajectory segments. It contains the same information as bits 16-23 of the [Trajectory Buffer Status](#) object (index 0x2012), below.

TRAJECTORY BUFFER STATUS**INDEX 0x2012**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	-	See <i>Description</i> , below.	EVENT	-

Description

This object gives access to status information about the IP trajectory buffer. The status value is bit-mapped as follows:

Bit(s) Description

0-15	These bits hold the 16-bit segment identifier of the next IP move segment expected. If a segment error has occurred (i.e. the segment integrity counter of a received message was out of order), then these bits may be consulted to determine the ID of the segment that should have been received.
16-23	The number of free locations in the IP buffer.
24	Set if a segment sequence error is in effect. A segment sequence error occurs when an IP segment is received with the incorrect value in its integrity counter.
25	Set if a buffer overflow has occurred.
26	Set if a buffer underflow has occurred.
27-30	Reserved for future use.
31	This bit is set if the IP buffer is empty.

This object is intended to be read using a PDO, and has a PDO event associated with it. The event occurs when one of the error bits (24 – 26) is set, or when the trajectory generator removes a segment from the trajectory buffer.

NEXT TRAJECTORY SEGMENT ID**INDEX 0x2013**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	YES	R

Description

This object gives the full 16-bit value of the next trajectory segment expected by the buffer interface. It contains the same information as bits 0-15 of the [Trajectory Buffer Status](#) object (index [0x2012](#)).

INTERPOLATION SUBMODE SELECT**INDEX 0x60C0**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	-	YES	R

Description

Determines which interpolation submode to use:

Submode	Description
0	Linear interpolation with a constant time.
-1	Linear interpolation with variable time.
-2	Cubic polynomial interpolation, which is also known as position, velocity, and time (PVT) interpolation. NOTE: Copley Controls provides a set of alternate objects (0x 2010, 0x 2011, 0x 2012, and 0x 2013) for efficient PVT move handling. When using the alternate objects, it is not necessary to set a linear interpolation submode using Interpolation Submode Select.

INTERPOLATION DATA RECORD**INDEX 0x60C1**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	R

Description

This object is used to send interpolation data to the amplifier's interpolation buffer.

INTERPOLATION POSITION TARGET**INDEX 0x60C1, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	Counts	-	YES	R

Description

A target position. Used in all three interpolation modes.

INTERPOLATION TIME**INDEX 0x60C1, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	milliseconds	-	YES	R

Description

The time interval of the move segment that starts with the Interpolation Position Target (Sub-Index 1), and extends to the next segment. Not used with interpolation mode 0 (linear interpolation with a constant time). In interpolation mode -1 (linear interpolation with variable time), writing to this object causes the entire record to be written to the interpolation buffer. Writing a value of zero to this object indicates the end of the interpolated move.

INTERPOLATION VELOCITY**INDEX 0x60C1, SUB-INDEX 3**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	0.1 counts/sec	-	YES	R

Description

Used only in interpolation mode -2 (PVT). This is the velocity used to drive the axis to the Interpolation Position Target (Sub-Index 1) within the Interpolation Time (Sub-Index 2). Writing to this object causes the entire record to be written to the interpolation buffer.

INTERPOLATION CONSTANT TIME**INDEX 0x60C2**

Type	Access	Units	Range	Map PDO	Memory
Record	RW	-	-	YES	R

Description

Used only in interpolation mode 0 (linear interpolation with a constant time). Defines the segment interval.

INTERPOLATION CONSTANT TIME INDEX**INDEX 0x60C2, SUB-INDEX 1**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 8	RW	variable	0 - 255	YES	R

Description

This object sets the constant time that is associated with each trajectory segment in interpolation mode 0.

INTERPOLATION CONSTANT TIME UNITS**INDEX 0x60C2, SUB-INDEX 2**

Type	Access	Units	Range	Map PDO	Memory
Integer 8	RW	-	-3 to -6	YES	R

Description

This object, which always returns the value -3 indicating that Interpolation Constant Time index is always formatted in units of milliseconds..

CHAPTER

9: CYCLIC SYNCHRONOUS MODES

This section describes cyclic synchronous operating modes. In these this modes, trajectory generation is done in the master computer (control device), not in the drive, and data is sent to the axes in synchronous updates of position, velocity or torque.

In cyclic synchronous modes PDOs are used to send commands to the drive, which responds immediately, without setting bit 4 in the Control Word 0x6040 (as is done in Profile Position Mode). These commands are affected by limiting parameters that are usually sent via SDOs and don't require cyclical updating.

For more information go to <http://www.can-cia.org/index.php?id=530>.

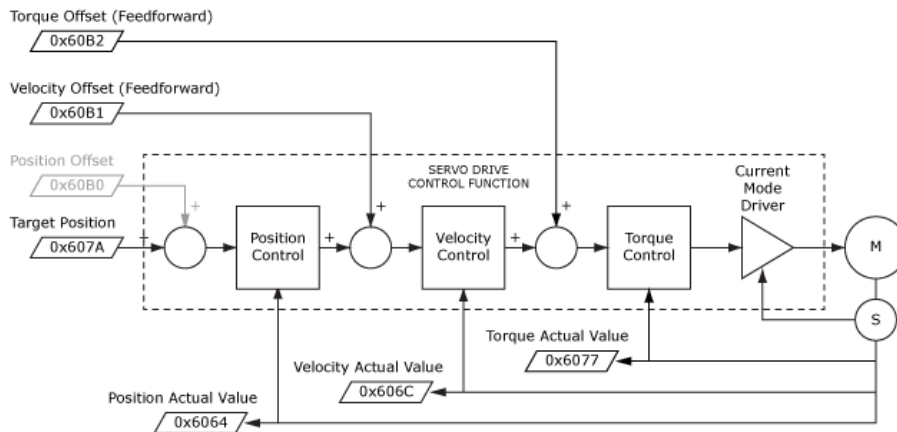

Contents of this Section include:

9.1: Cyclic Synchronous Position Mode (CSP)	220
9.2: Cyclic Synchronous Velocity Mode (CSV)	221
9.3: Cyclic Synchronous Torque Mode (CST).....	222

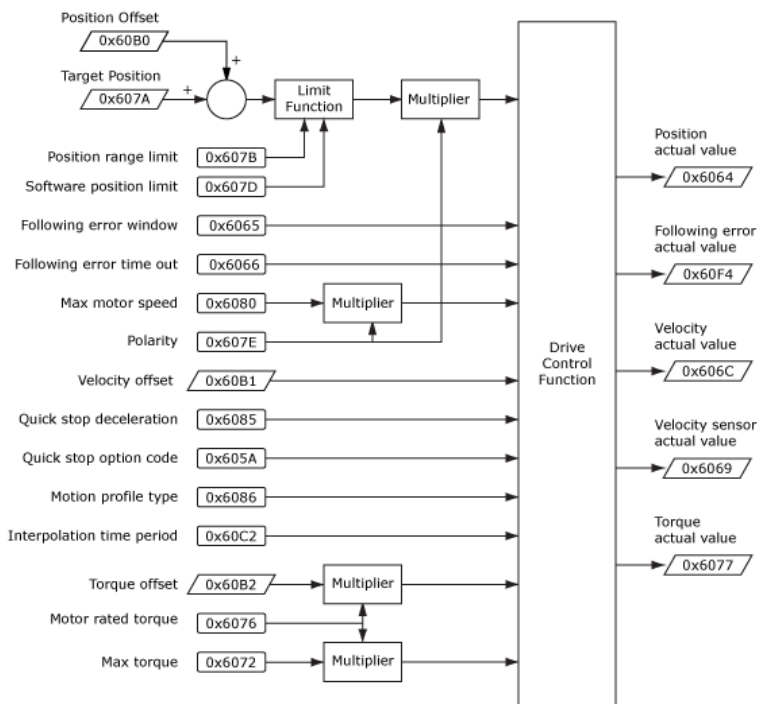

9.1: Cyclic Synchronous Position Mode (CSP)

In this mode the controller generates a trajectory and sends increments of position, along with velocity and current feed-forward values, to the drive. The primary feedback from the drive is the actual motor position and optionally, actual motor velocity and torque. Position, velocity, and torque control loops are all closed in the servo drive which acts as a follower for the position commands.

The diagram below shows an overview of the cascading control structure in CSP mode. Objects in parallelograms are real-time PDO data. Other objects in rectangles are usually configured SDOs, non-synchronously.

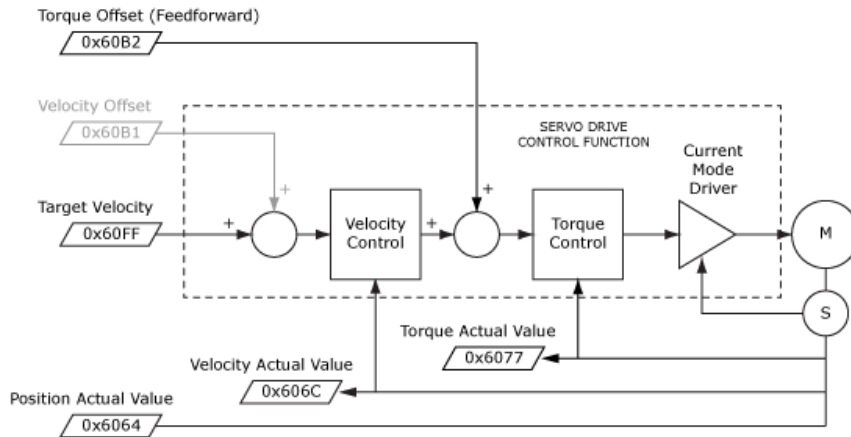

This diagram shows the CSP control function with real-time and other configuration parameters.

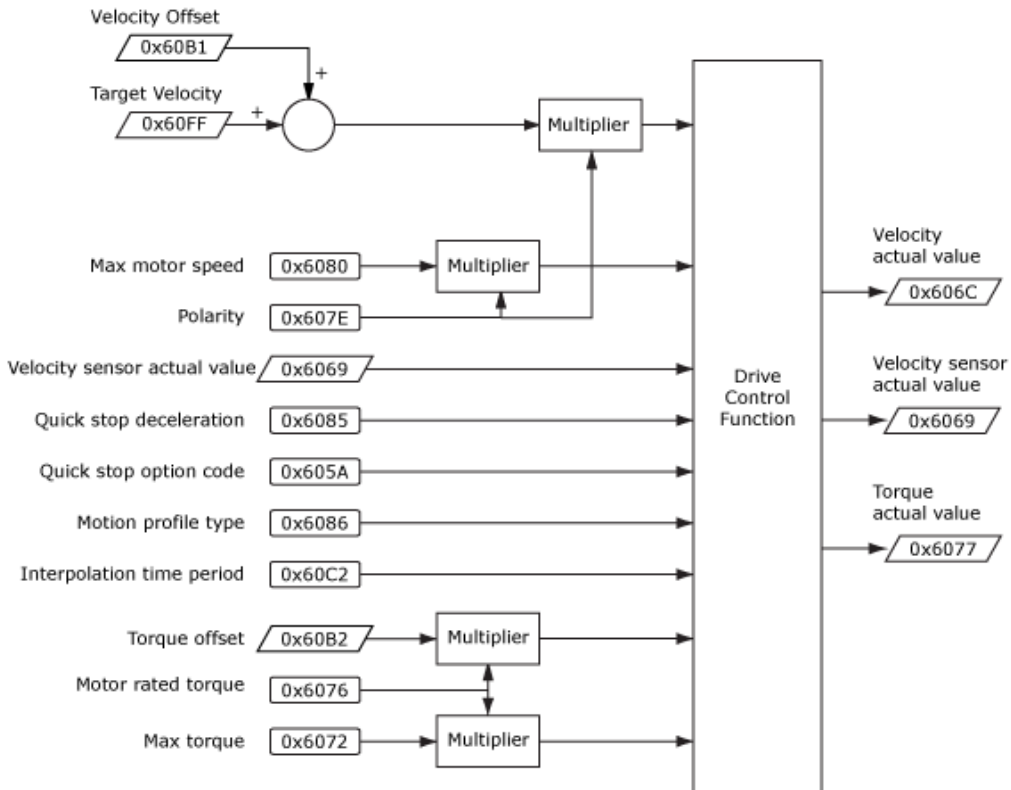

9.2: Cyclic Synchronous Velocity Mode (CSV)

CSV mode is frequently used with controllers that close the position loop and use the position error to command the velocity of the servo drive (which can also accept a torque feedward value). Velocity and torque loops are closed in the servo drive.

The diagram below shows an overview of the cascading control structure in cyclic synchronous velocity mode (CSV).

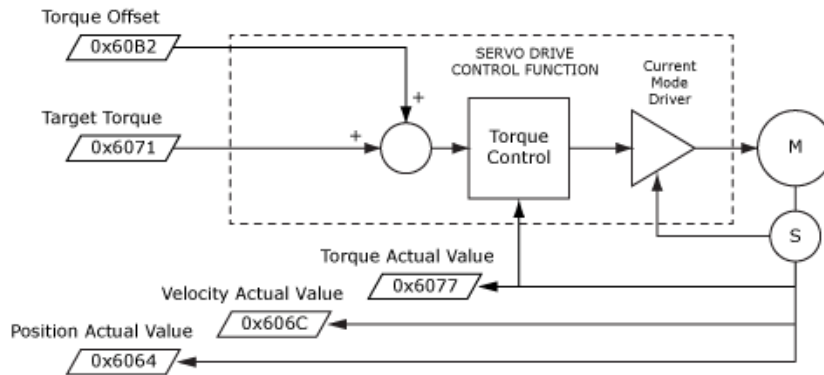

This diagram shows the CSV control function with real-time and other configuration parameters.

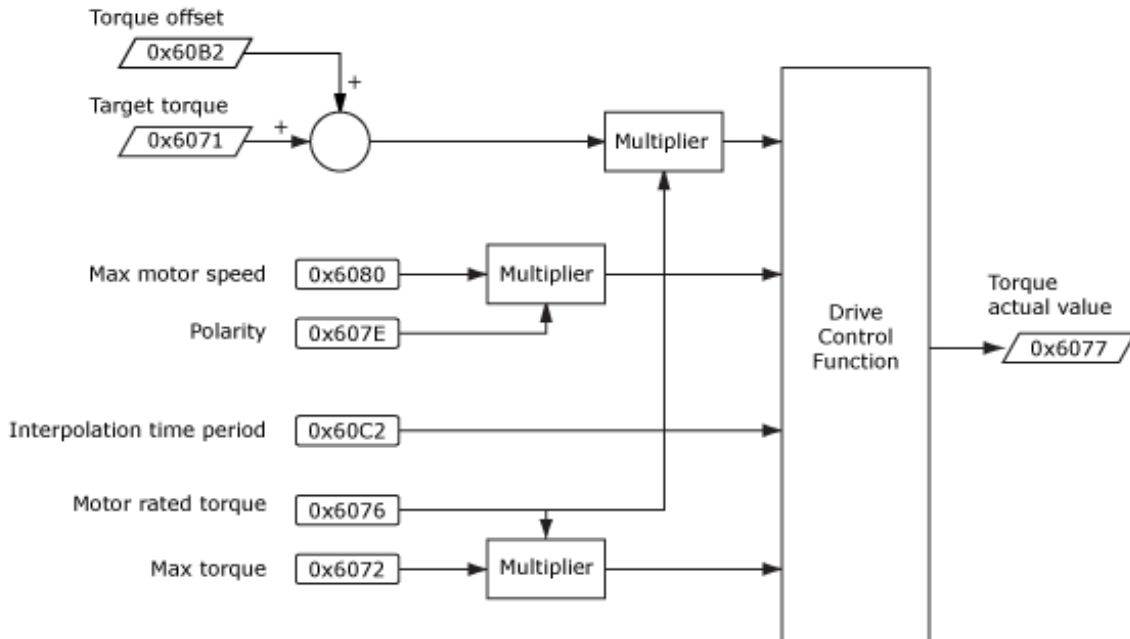

9.3: Cyclic Synchronous Torque Mode (CST)

When the controller has a full PID compensator to control position and velocity, the output is a torque command to the servo drive. A torque offset value is used for vertical loads to balance against gravity so that the torque command from the controller produces symmetrical acceleration up and down.

The diagram below shows an overview of the cascading control structure in cyclic synchronous torque mode (CST).

This diagram shows the CST control function with real-time and other configuration parameters.

APPENDIX

A: ALTERNATIVE CONTROL SOURCES

This chapter describes control of an amplifier by a source other than the CANopen network.

Contents include:

A.1: Alternative Control Sources Overview	224
A.2: Alternative Control Source Objects	225
A.3: Running CAM Tables from RAM	231

A.1: Alternative Control Sources Overview

Typically, when a Copley amplifier is used on a CANopen network, the CANopen master uses the network to send commands that drive the amplifier's position, velocity, or current loop.

Alternately, an amplifier on a CANopen network can accept position, velocity, or current commands over the device's serial port, digital I/O channels, or analog reference inputs, or run under the control of the amplifier's internal generator or a Copley Virtual Machine (CVM) program. Use the [Indexer Register Values](#) object (index [0x2600](#), p. [230](#)) to read and write the CVM Indexer program registers.

An amplifier can also run in camming mode to execute moves programmed in camming tables. The [Camming Configuration](#) object (index [0x2360](#), p. [228](#)) and several other objects described in this chapter are used to configure and operate the amplifier in camming mode.

Even while operating under an alternative control source, a device's status can still be monitored over the CANopen network.

Specify a control source by choosing a mode in the [Desired State](#) object (index [0x2300](#)). For more information, see page [65](#).

Other objects affect the amplifier under alternative control sources. They are described in the next section.

A.2: Alternative Control Source Objects

Contents of this Section

This section describes objects related to alternate sources of amplifier control.

They include:

Micro-Stepping Rate Index 0x21C1	226
Analog Reference Scaling Factor Index 0x2310	226
Analog Reference Offset Index 0x2311	226
Analog Reference Calibration Offset Index 0x2312	226
Analog Reference Deadband Index 0x2313	226
Secondary Analog Reference Value Index 0x2208	226
Motor Temp Sensor Voltage Index 0x2209	227
Motor Temp Sensor Limit Index 0x220A	227
PWM Input Frequency Index 0x2322	227
Function Generator Configuration Index 0x2330	227
Function Generator Frequency Index 0x2331	228
Function Generator Amplitude Index 0x2332	228
Function Generator Duty Cycle Index 0x2333	228
Camming Configuration Index 0x2360	228
Cam Delay Forward Index 0x2361	229
Cam Delay Reverse Index 0x2362	229
Cam Master Velocity Index 0x2363	229
Trace Buffer Reserved Size Index 0x250A	229
Trace Buffer Address Index 0x250B	229
Trace Buffer Data Index 0x250C	229
Indexer Register Values Index 0x2600	230
Indexer Register Values Index 0x2600, Sub-Index 1-32	230

MICRO-STEPPING RATE**INDEX 0x21C1**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	degrees / sec	0 - 32,767	YES	RF

Description

This value is only used when running in diagnostic micro-stepping mode. It gives the step angle update rate. See [Desired State](#) object (index 0x2300, p. 65), code 42.

ANALOG REFERENCE SCALING FACTOR**INDEX 0x2310**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	See <i>Description</i> , below.	-	YES	RF

Description

When running in a mode that relies on the analog reference as an input, this object defines the scaling that is applied to the analog reference input. See [Desired State](#) object (index 0x2300, p. 65, codes 2, 12, 22).

Mode	Scaling
Current	0.01 Amps / 10 volt.
Velocity	0.1 counts / second / 10 volt.
Position	1 Count / 10 volt.

ANALOG REFERENCE OFFSET**INDEX 0x2311**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	millivolts	-	YES	RF

Description

This is one of two offset values applied to the analog reference input before it is used in calculations.

ANALOG REFERENCE CALIBRATION OFFSET**INDEX 0x2312**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	millivolts	-	YES	RF

Description

This voltage is added to the analog command input and is calibrated at the factory to give a zero reading for zero input voltage. It is one of two offset values applied to the analog reference input before the input is used in calculations.

ANALOG REFERENCE DEADBAND**INDEX 0x2313**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	millivolts	-	YES	RF

Description

The analog reference input is subject to a non-linear adjustment to clip reading around zero. This object defines the size of that window.

SECONDARY ANALOG REFERENCE VALUE**INDEX 0x2208**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RO	mV	-	YES	RF

Description

Secondary analog reference value.

MOTOR TEMP SENSOR VOLTAGE**INDEX 0x2209**

Type	Access	Units	Range	Map PDO	Memory
Integer16	R	mV	-	YES	R

Description

Present voltage at analog motor temperature sensor.

MOTOR TEMP SENSOR LIMIT**INDEX 0x220A**

Type	Access	Units	Range	Map PDO	Memory
Integer16	RW	mV	-	YES	RF

Description

Limit for analog motor temperature sensor.

If this parameter is set to zero, then the analog motor temperature sensor is disabled.

If this parameter is set to a positive value, then a motor temperature error will occur any time the voltage on the motor temperature input exceeds this value (in millivolts).

If this parameter is negative, then a motor temperature error will occur any time the voltage on the motor temperature input is lower than the absolute value of this limit in millivolts.

PWM INPUT FREQUENCY**INDEX 0x2322**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	10 Hz	-	YES	RF

Description

This is the frequency of the PWM for use only in UV commutation mode ([Desired State](#) object [index [0x2300](#), p. [65](#)] = 5).

FUNCTION GENERATOR CONFIGURATION**INDEX 0x2330**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	See Description, below.	YES	RF

Description

Configures the amplifier's internal function generator, which can drive the current, velocity, or position loop. Bit-mapped:

Bits	Description
0-1	Function code.
2-11	Reserved for future use.
12	One-shot mode. If set, the function code is reset to zero (disabled) after one complete waveform.
13	Invert every other waveform if set.
14-15	Reserved for future use.

The function code programmed into bits 0-1 defines the type of waveform to be generated:

Code	Describe
0	None (disabled)
1	Square wave.
2	Sine wave.

Note that the amplifier is placed under control of the function generator by setting the [Desired State](#) object (index [0x2300](#), p. [65](#)) to one of the following values:

- 4 (function generator drives current loop);
- 14 (function generator drives velocity loop);
- 24 (function generator drives position loop in servo mode);
- 34 (function generator drives position loop in stepper mode).

FUNCTION GENERATOR FREQUENCY**INDEX 0x2331**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	Hz	0 – 32,767	YES	RF

Description

This object gives the frequency of the internal function generator.

FUNCTION GENERATOR AMPLITUDE**INDEX 0x2332**

Type	Access	Units	Range	Map PDO	Memory
Integer 32	RW	See <i>Description</i> , below	See <i>Description</i> , below	YES	RF

Description

The amplitude of the signal generated by the internal function generator. The units depend on the servo operating mode:

Mode	Units
Current	0.01 Amps
Velocity	0.1 counts/second.
Position	Counts.

FUNCTION GENERATOR DUTY CYCLE**INDEX 0x2333**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	0.1 percent	0 – 1,000	YES	RF

Description

This object gives the function generator duty cycle for use with the square wave function. It has no effect when running the sine function.

CAMMING CONFIGURATION**INDEX 0x2360**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	YES	RF

Description

Configures Camming Mode operation:

Bits	Description
0-3	ID Number of the Cam Table to use (0-9)
4	Reserved.
5	If set, exit table in forward direction.
6	If set, use the Camming Internal Generator. The internal generator runs at the constant velocity programmed in Cam Master Velocity (index 0x2363 , p. 229). If clear, use digital command input as configured in using Copley's CME 2 software camming controls or Input Pin States (index 0x2190 , p. 116)
7	If set, run tables stored in RAM. If clear, use tables stored in the flash file system.
8-11	Input number to use as Cam Trigger. Note: a value of 0 selects IN1, value of 1 selects IN2, etc.
12-13	Cam Trigger type:
	Value Type
	0 None (Continuous): The active Cam Table is repeated continuously.
	1 Use Input, Edge: The active Cam Table begins executing on the rising edge of the input pin selected by bits 8-11.
	2 Use Input, Level: The active Cam Table will run as long as the input selected by bits 8-11 is high.
	3 Use Master (Secondary) Encoder Index: The active Cam Table is executed when the amplifier receives an index pulse from the Master encoder. Index pulses received during execution are ignored.

CAM DELAY FORWARD**INDEX 0x2361**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	Master Counts.	0 - 32,767	YES	RF

Description

The delay applied before beginning a camming profile after the trigger has been activated, in a forward direction.

CAM DELAY REVERSE**INDEX 0x2362**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	Master Counts.	0 - 32,767	YES	RF

Description

The delay (in master counts) applied before beginning a camming profile after the trigger has been activated, in a reverse direction.

CAM MASTER VELOCITY**INDEX 0x2363**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	0.1 counts/second	-500,000,000 - 500,000,000	YES	RF

Description

Virtual master encoder velocity for camming mode.

TRACE BUFFER RESERVED SIZE**INDEX 0x250A**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	words	0 - 2048	YES	R

Description

The number of RAM words in the amplifier Trace Buffer to reserve for [Trace Buffer Data](#) (such as CAM tables).

TRACE BUFFER ADDRESS**INDEX 0x250B**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	words	0 - 2048	YES	R

Description

An offset from the beginning of the memory reserved for [Trace Buffer Data](#) (index [0x250C](#), p. [229](#)). Designates the location where the next [Trace Buffer Data](#) write (such as a CAM table master/slave value pair) will be stored.

TRACE BUFFER DATA**INDEX 0x250C**

Type	Access	Units	Range	Map PDO	Memory
Variable length	RW	-	-	YES	R

Description

The first value written to this object will be stored in trace buffer RAM at the location specified by [Trace Buffer Address](#) (index [0x250B](#), p. [229](#)). On each subsequent write to this object, an internal pointer is incremented and the value will be written to the next memory location. One use of this data object is the storage of CAM Table master/slave position value pairs.

INDEXER REGISTER VALUES**INDEX 0x2600**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	-	NO	R

Description

This array object holds the values of the 32 programmable registers (0-31) maintained by the CVM Indexer Program. Each sub-index object 1-32 contains the value of an Indexer Program register (sub-index object 1 contains the value of Indexer Program register 0, sub-index object 32 contains the value of register 31).

Note: When the CVM Indexer program is started, all registers are initialized to zero.

INDEXER REGISTER VALUES**INDEX 0x2600, SUB-INDEX 1-32**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RW	-	-	YES	R

Description

One sub-index object for each Indexer program register.

A.3: Running CAM Tables from RAM

Normally, Cam Tables are stored in the amplifier's flash memory, allowing the Cam Tables to be uploaded once and persist between power cycles.

In applications where flash storage is not appropriate or optimal, up to 16 Cam Tables can be loaded into and run from amplifier RAM.

(For a full description of camming, see the *Copley Camming User Guide*.)

Cam Tables in Amplifier RAM

NOTE: Increments vs. Positions. When entering Cam Table data in CME 2, the user enters pairs of absolute master and slave positions. CME 2 then converts the absolute position values to increment values. When writing Cam Table data to amplifier RAM, the controller program must write increment values (not absolute position values).

Using the Trace Buffer RAM Area for Cam Tables

Cam tables can be stored in and run from the area of amplifier RAM called the trace buffer. This RAM area is normally reserved for trace data collected by the CME 2 Scope Tool. When not needed for trace data, it may be used for other purposes, including the storage of Cam Tables.

RAM Cam Table Capacity

The Trace Buffer is 2048 16-bit words long. It can store up to 16 Cam Tables.

The maximum number of master/slave increment value pairs that can be stored in RAM varies. If the master increment is constant, a compressed format can be used.

Furthermore, each Cam Table requires two words of metadata, so using 16 tables would reduce the data allocation by 32 words.

Using one table in compressed format, about 2,000 master/slave increment value pairs can be represented. A typical maximum is about 1000 value pairs.

CAM Table Structure

When used for Cam Tables, the trace buffer begins with Cam Table metadata consisting of up to 16 word pairs (32 words). The first word in each pair defines the address (offset from the beginning of the buffer). The second word contains the length of the Cam Table.

The metadata is followed by Cam Table data, starting at the address (offset) specified in the metadata.

In standard format, Cam Table data consists of master/slave increment value pairs. The first word in a pair contains a master increment and the second word contains the corresponding slave increment.

A compressed format may be used when the master increment changes at a constant rate as described in [Compressed Format for Uniform Master Increments](#) (p. 233).

NOTE: The controller program must make sure that there is a pair of metadata words for each Cam Table. The metadata rows must start at address (offset) 0 and must be in table ID order. For instance, the metadata pair that begins at address 0 defines Cam Table 0, the metadata pair that begins at address 2 defines Cam Table 1, etc. When configured to run Cam Table 0, the amplifier will look at address 0 for a metadata pair. When configured to run Cam Table 1, the amplifier will look at address 2, and so on.

Example: Single Cam Table

The following example shows a single Cam Table (identified at run time as Cam Table 0) stored in the trace buffer RAM area. The first pair of words contains the Cam Table's metadata. Word 1 contains the address (offset) to the beginning of Cam Table 0. The second word contains the length of the table.

The remaining words begin at address 2 and contain Cam Table data in the form of master/slave increment value pairs.

Address	Data	Data Description
0	2	Address of the start of Cam Table 0.
1	30	Length of Cam Table 0.
2	100	A master/slave increment value pair. For each 100 master increments, the slave axis is incremented 50 encoder counts.
3	50	
4--31	xxxx	Additional master/slave increment value pairs.

Example: Multiple Cam Tables

The following example shows three Cam Tables stored in the trace buffer RAM area. The first pair of words contains the metadata for Cam Table 0. The second and third word pairs contain the metadata for Cam Tables 1 and 2, respectively.

The remaining words begin at address 6 and contain Cam Table data, in the form of master/slave increment value pairs, for the three Cam Tables.

Address	Data	Data Description
0	2	Address of the start of the Cam Table 0.
1	30	Length of Cam Table 0.
2	36	Address of the start of Cam Table 1.
3	24	Length of Cam Table 1.
4	60	Address of the start of Cam Table 2.
5	64	Length of Cam Table 2.
6—35	xxxx	Cam Table 0 data in the form of master/slave increment value pairs.
36—59	xxxx	Cam Table 1 data in the form of master/slave increment value pairs.
60—123	xxxx	Cam Table 2 data in the form of master/slave increment value pairs.

Compressed Format for Uniform Master Increments

When the Cam Master increments at a constant rate, a compressed format may be used to save RAM space.

In standard format, each master/slave increment value pair is expressed using two words, one for the master and one for the slave.

In the compressed format, the constant master increment is stored in the table's first data word and the slave increments are stored in the subsequent data words.

To indicate that the compressed format is used, set bit 14 of the first data word (which contains the master increment value). Clear bit 15.

Example: A Table in Compressed Format

Address	Data	Data Description
0	2	Address of the start of Cam Table 0.
1	30	Length of Cam Table 0.
2	50	The constant master increment. To indicate that this is a constant master increment for a compressed table, bit 14 is set and bit 15 is clear.
3—31	xxxx	A series of slave increment values.

Procedures for Running Cam Tables from RAM

Process overview:

1. Allocate RAM for Cam Tables

Write to

[Trace Buffer Reserved Size](#) (index [0x250A](#), p. [229](#)) the number of memory words to reserve for Cam Tables.

2. Load a Cam Table into RAM

Write to [Trace Buffer Address](#) (index [0x250B](#), p. [229](#)) the Cam Table's initial offset value.

Write a series of values to [Trace Buffer Data](#) (index [0x250C](#), p. [229](#)).

For standard table format, the series starts with a master increment value followed by the corresponding slave increment, and the master/slave pairing sequence is repeated for each row of Cam Table data.

For compressed table format, the first value is the constant master increment value. Bit 14 of this first word is set, and bit 15 is clear. Subsequent values written to [Trace Buffer Data](#) represent the series of slave increments.

Each time a value is written to or read from [Trace Buffer Data](#), the amplifier increments the offset pointer in [Trace Buffer Address](#).

3. Configure the Camming Parameters

To configure the amplifier to run Cam Tables from RAM, set bit 7 in the [Camming](#) Configuration object (index [0x2360](#), p. [228](#)). Set other parameters as needed.

4. Run a Cam Table from RAM

Set the [Desired State](#) object (index [0x2300](#), p. [65](#)) to 25 (camming mode).

The Cam Table selected in bits 0-3 of the [Camming](#) Configuration object will be run in response to the trigger events specified in bits 12-13 of the [Camming Configuration](#) object.

APPENDIX

B: TRACE TOOL

This chapter describes the CANopen interface to the Copley Controls Trace Tool.

Contents include:

B.1: Trace Tool Overview	236
B.2: Trace Tool Objects	237

B.1: Trace Tool Overview

Overview

The Copley Controls trace tool allows the programmer to configure and monitor up to 6 motion trace channels. Each channel can be configured to monitor any of a number of trace variables. Other configuration choices include the trace period and trace trigger.

B.2: Trace Tool Objects

Contents of this Section

This section describes objects related to the Trace Tool. They include:

Trace Channels Index 0x2500	238
Trace Channels Index 0x2500, Sub-Index 1-6.....	238
Trace Status Index 0x2501	239
Trace Reference Period Index 0x2502	239
Trace Period Index 0x2505	239
Trace Sample Count Index 0x2503.....	240
Trace Max Samples Index 0x2504.....	240
Trace Trigger Configuration Index 0x2506.....	240
Trace Delay Index 0x2507	241
Trace Start/Stop Index 0x2508.....	241
Trace Data Index 0x2509.....	241

TRACE CHANNELS**INDEX 0x2500**

Type	Access	Units	Range	Map PDO	Memory
Array	RW	-	See description , below.	NO	-

Description

This object uses 6 sub-indices configure up to 6 trace channels.

TRACE CHANNELS**INDEX 0x2500, SUB-INDEX 1-6**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	NO	R

Sub-object x configures trace channel x. Each channel can be configured to monitor one of the trace variables described below by programming the sub-object with the code.

Code	Trace Variable
0	No data. Setting a channel to this value disables it. Disabling unused channels saves space in the trace buffer.
3	Current reading winding A (0.01 amps)
4	Current reading winding B (0.01 amps)
5	Reference A/D reading (millivolts)
6	High voltage reference (0.1 volts)
7	Commanded torque
8	Limited torque
9	Commanded current (D rotor axis) (0.01 amps)
10	Commanded current (Q rotor axis) (0.01 amps)
11	Actual current (X stator axis) (0.01 amps)
12	Actual current (Y stator axis) (0.01 amps)
13	Actual current (D rotor axis) (0.01 amps)
14	Actual current (Q rotor axis) (0.01 amps)
15	Current Error (D rotor axis) (0.01 amps)
16	Current Error (Q rotor axis) (0.01 amps)
17	Current Integral (D rotor axis)
18	Current Integral (Q rotor axis)
19	Current loop output (D rotor axis)
20	Current loop output (Q rotor axis)
21	Current loop output (X stator axis)
22	Current loop output (Y stator axis)
23	Actual motor velocity (0.1 counts/sec or 0.01 RPM if using back EMF velocity estimate).
24	Commanded motor velocity.
25	Limited motor velocity command.
26	Velocity loop error.
27	Velocity loop integral.
28	Actual load position (counts).
29	Commanded position.
30	Position loop error
31	Motor encoder position (counts)
32	Position loop output velocity
33	Raw input pin readings (no debounce)
34	reserved
35	reserved
Continued...	

...continued:	
Code	Trace Variable
36	Motor phase angle (1 degree units)
37	Amplifier temperature (degrees C)
38	Amplifier Manufacturer Status Register (index 0x1002, p. 60)
39	Amplifier event latch word
40	Hall sensor state
41	Position Capture Status Register (index 0x2401, p. 186)
42	Index capture register
43	Load encoder velocity (0.1 counts / second).
44	Velocity command from trajectory generator (0.1 counts/sec)
45	Acceleration command from trajectory generator (10 counts/sec ²)
46	The analog encoder sine input. Only valid for amplifiers with analog encoder support.
47	The analog encoder cosine input. Only valid for amplifiers with analog encoder support.
48	The value of the digital inputs (after debounce)
49	The destination position input to the trajectory generator.
50	Actual motor velocity as seen by velocity loop. This is an unfiltered version of trace variable.
51	Load encoder position (counts).
52	Gain scheduling key parameter value.
53	Position loop P gain
54	Velocity loop P gain
55	Velocity loop I gain

TRACE STATUS**INDEX 0x2501**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	R0	-	-	YES	R

Description

Get trace status:

Bits	Description
0	Set if trace data is currently being collected.
1	Set if trigger has occurred.
2-15	Reserved for future use.

TRACE REFERENCE PERIOD**INDEX 0x2502**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 32	RO	nanoseconds	-	NO	R

Description

Get fundamental period. Returns a 32-bit value containing the fundamental trace period in units of nanoseconds. The fundamental period is the maximum frequency at which the trace system can sample data. The actual trace period is set in integer multiples of this value using the Trace Period object (0x2505).

TRACE PERIOD**INDEX 0x2505**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	See description.	-	NO	R

Description

The trace period, in integer multiples of the Trace Reference Period (0x2502).

TRACE SAMPLE COUNT**INDEX 0x2503**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	YES	R

Description

Returns the number of samples collected so far.

TRACE MAX SAMPLES**INDEX 0x2504**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RO	-	-	NO	R

Description

Get maximum samples. The maximum number of samples that the internal trace memory buffer can hold is calculated and returned as a 16-bit value. Note that the maximum number of samples is dependent on the number and type of active trace variables. For an accurate value, the trace variables should be set first; then the maximum number of samples available may be requested.

TRACE TRIGGER CONFIGURATION**INDEX 0x2506**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 48	RW	-	-	NO	R

Description

Set/get the trace trigger configuration.

Bits	Description																								
0-3	Channel number to trigger on (if applicable).																								
4-7	Reserved.																								
8-11	Trigger type (may be interpreted differently for some trigger types):																								
	<table> <tr> <th>Type</th><th>Description</th></tr> <tr> <td>0</td><td>No trigger in use.</td></tr> <tr> <td>1</td><td>Trigger as soon as the selected channel's input is greater than or equal to the trigger level.</td></tr> <tr> <td>2</td><td>Trigger as soon as the selected channel's input is less than or equal to the trigger level.</td></tr> <tr> <td>3</td><td>Trigger when the selected channel's input changes from below to above the trigger level.</td></tr> <tr> <td>4</td><td>Trigger when the selected channel's input changes from above to below the trigger level.</td></tr> <tr> <td>5</td><td>Trigger when any selected bits in the channel value are set. The bits are selected using the trigger level value as a mask.</td></tr> <tr> <td>6</td><td>Trigger when any selected bits in the channel value are clear. The bits are selected using the trigger level value as a mask.</td></tr> <tr> <td>7</td><td>Trigger any time the selected channel value changes.</td></tr> <tr> <td>8</td><td>The trigger level mask selects one or more bits in the Manufacturer Status Register (index 0x1002, p. 60). The trigger occurs when any of these bits change from 0 to 1. In this mode, the channel number selected by the trigger is not used.</td></tr> <tr> <td>9</td><td>Like type 8, but the trigger occurs when the bit(s) change from 1 to 0.</td></tr> <tr> <td>10</td><td>Trigger on the start of the next function generator cycle. This trigger type is only useful when running in function generator mode. The trigger channel number isn't used.</td></tr> </table>	Type	Description	0	No trigger in use.	1	Trigger as soon as the selected channel's input is greater than or equal to the trigger level.	2	Trigger as soon as the selected channel's input is less than or equal to the trigger level.	3	Trigger when the selected channel's input changes from below to above the trigger level.	4	Trigger when the selected channel's input changes from above to below the trigger level.	5	Trigger when any selected bits in the channel value are set. The bits are selected using the trigger level value as a mask.	6	Trigger when any selected bits in the channel value are clear. The bits are selected using the trigger level value as a mask.	7	Trigger any time the selected channel value changes.	8	The trigger level mask selects one or more bits in the Manufacturer Status Register (index 0x1002, p. 60). The trigger occurs when any of these bits change from 0 to 1. In this mode, the channel number selected by the trigger is not used.	9	Like type 8, but the trigger occurs when the bit(s) change from 1 to 0.	10	Trigger on the start of the next function generator cycle. This trigger type is only useful when running in function generator mode. The trigger channel number isn't used.
Type	Description																								
0	No trigger in use.																								
1	Trigger as soon as the selected channel's input is greater than or equal to the trigger level.																								
2	Trigger as soon as the selected channel's input is less than or equal to the trigger level.																								
3	Trigger when the selected channel's input changes from below to above the trigger level.																								
4	Trigger when the selected channel's input changes from above to below the trigger level.																								
5	Trigger when any selected bits in the channel value are set. The bits are selected using the trigger level value as a mask.																								
6	Trigger when any selected bits in the channel value are clear. The bits are selected using the trigger level value as a mask.																								
7	Trigger any time the selected channel value changes.																								
8	The trigger level mask selects one or more bits in the Manufacturer Status Register (index 0x1002, p. 60). The trigger occurs when any of these bits change from 0 to 1. In this mode, the channel number selected by the trigger is not used.																								
9	Like type 8, but the trigger occurs when the bit(s) change from 1 to 0.																								
10	Trigger on the start of the next function generator cycle. This trigger type is only useful when running in function generator mode. The trigger channel number isn't used.																								
12-14	Reserved.																								
15	If set, take one sample per trigger event.																								

TRACE DELAY**INDEX 0x2507**

Type	Access	Units	Range	Map PDO	Memory
Integer 16	RW	-	-	NO	R

Description

Set/get the delay between the trigger occurring and the start of captured data. The delay is given in units of trace periods (0x2505).

Note that the delay may be either positive or negative. A negative delay means that the data captured will precede the trigger event by the specified number of cycles. Although any input value is accepted, the number of samples preceding the trigger is limited to the length of the trace buffer and the number (and size) of channels being captured.

TRACE START/STOP**INDEX 0x2508**

Type	Access	Units	Range	Map PDO	Memory
Unsigned 16	RW	-	-	YES	R

Description

Write 0 to stop trace collection or a non-zero value to restart it.

TRACE DATA**INDEX 0x2509**

Type	Access	Units	Range	Map PDO	Memory
Octet	RO	-	-	NO	R

Description

After a trace has been collected, the trace data can be downloaded by reading from this object. The downloaded data should be viewed as an array of 32-bit samples.

APPENDIX

C: OBJECTS BY FUNCTION

This chapter lists the objects in functional groups. (The groupings match the titles of the sections of this manual that describe the objects.)

They include:

Objects that Define SDOs and PDOs	244
Network Management Objects.....	244
Device Control And Status Objects.....	244
Error Management Objects.....	245
Basic Amplifier Configuration Objects.....	245
Basic Motor Configuration Objects	247
Real-time Amplifier and Motor Status Objects	248
Digital I/O Configuration Objects.....	249
Position Loop Configuration Objects.....	249
Velocity Loop Configuration Objects	250
Current Loop Configuration Objects	250
Stepper Mode Objects	251
Homing Mode Operation Objects.....	251
Profile Mode Objects.....	251
Interpolated Position Mode Objects	252
Alternative Control Source Objects	252

Objects that Define SDOs and PDOs

Server SDO Parameters	Index 0x1200	31
SDO Receive COB-ID	Index 0x1200, Sub-Index 1	31
SDO Transmit COB-ID	Index 0x1200, Sub-Index 2	31
Receive PDO Communication Parameters	Index 0x1400 – 0x1407	31
PDO COB-ID	Index 0x1400 – 7, Sub-Index 1	31
PDO Type	Index 0x1400 – 7, Sub-Index 2	32
Receive PDO Mapping Parameters	Index 0x1600 – 0x1607	32
Number Of Mapped Objects	Index 0x1600 – 7, Sub-index 0	32
PDO Mapping	Index 0x1600 – 7, Sub-Index 1 – 8	32
Receive PDO Mapping Parameters	Index 0x1700	33
Number Of Mapped Objects	Index 0x1700, Sub-index 0	33

Motor Wiring Configuration	Index 0x2383, Sub-Index 3	92
Hall Sensor Type	Index 0x2383, Sub-Index 4	92
Hall Sensor Wiring	Index 0x2383, Sub-Index 5	92
Hall Offset	Index 0x2383, Sub-Index 6	93
Motor Resistance	Index 0x2383, Sub-Index 7	93
Motor Inductance	Index 0x2383, Sub-Index 8	93
Motor Inertia	Index 0x2383, Sub-Index 9	93
Motor Back EMF	Index 0x2383, Sub-index 10	93
Motor Maximum Velocity	Index 0x2383, Sub-Index 11	93
Motor Torque Constant	Index 0x2383, Sub-Index 12	93
Motor Peak Torque	Index 0x2383, Sub-Index 13	94
Motor Continuous Torque	Index 0x2383, Sub-Index 14	94
Motor Temperature Sensor	Index 0x2383, Sub-Index 15	94
Motor Has A Brake	Index 0x2383, Sub-Index 16	94
Motor Stopping Time	Index 0x2383, Sub-Index 17	94
Motor Brake Delay	Index 0x2383, Sub-Index 18	94
Motor Brake Velocity	Index 0x2383, Sub-Index 19	95
Encoder Type Code	Index 0x2383, Sub-Index 20	95
Encoder Units	Index 0x2383, Sub-Index 21	95
Motor Encoder Direction	Index 0x2383, Sub-Index 22	95
Motor Counts/Rev	Index 0x2383, Sub-Index 23	96
Motor Encoder Resolution	Index 0x2383, Sub-Index 24	96
Motor Electrical Distance	Index 0x2383, Sub-Index 25	96
Reserved	Index 0x2383, Sub-Index 26-27	96
Analog Encoder Shift	Index 0x2383, Sub-Index 28	96
Microsteps/Rev	Index 0x2383, Sub-Index 29	96
Load Encoder Type	Index 0x2383, Sub-Index 30	97
Load Encoder Direction	Index 0x2383, Sub-Index 31	97
Load Encoder Resolution	Index 0x2383, Sub-Index 32	97
Bi-Quad Filter Coefficients	Index 0x2383, Sub-Index 33	97
Number of Resolver Cycles/Motor Rev	Index 0x2383, Sub-Index 34	97
Motor Data	Index 0x6410	98
Motor Type	Index 0x6410, Sub-Index 1	98
Motor Pole Pairs	Index 0x6410, Sub-Index 2	98
Motor Wiring Configuration	Index 0x6410, Sub-Index 3	98
Hall Sensor Type	Index 0x6410, Sub-Index 4	98
Hall Sensor Wiring	Index 0x6410, Sub-Index 5	99
Hall Offset	Index 0x6410, Sub-Index 6	99
Motor Resistance	Index 0x6410, Sub-Index 7	99
Motor Inductance	Index 0x6410, Sub-Index 8	99
Motor Inertia	Index 0x6410, Sub-Index 9	100
Motor Back EMF	Index 0x6410, Sub-index 10	100
Motor Maximum Velocity	Index 0x6410, Sub-Index 11	100
Motor Torque Constant	Index 0x6410, Sub-Index 12	100
Motor Peak Torque	Index 0x6410, Sub-Index 13	100
Motor Continuous Torque	Index 0x6410, Sub-Index 14	100
Motor Temperature Sensor	Index 0x6410, Sub-Index 15	100
Motor Has A Brake	Index 0x6410, Sub-Index 16	101
Motor Stopping Time	Index 0x6410, Sub-Index 17	101
Motor Brake Delay	Index 0x6410, Sub-Index 18	101
Motor Brake Velocity	Index 0x6410, Sub-Index 19	101
Encoder Type Code	Index 0x6410, Sub-Index 20	102

Encoder Units	Index 0x6410, Sub-Index 21	102
Motor Encoder Direction	Index 0x6410, Sub-Index 22	102
Motor Counts/Rev	Index 0x6410, Sub-Index 23	102
Motor Encoder Resolution	Index 0x6410, Sub-Index 24	103
Motor Electrical Distance	Index 0x6410, Sub-Index 25	103
Encoder Index Pulse Distance	Index 0x6410, Sub-Index 26	103
Motor Units	Index 0x6410, Sub-Index 27	103
Analog Encoder Shift	Index 0x6410, Sub-Index 28	103
Microsteps/Rev	Index 0x6410, Sub-Index 29	103
Load Encoder Type	Index 0x6410, Sub-Index 30	104
Load Encoder Direction	Index 0x6410, Sub-Index 31	104
Load Encoder Resolution	Index 0x6410, Sub-Index 32	104
Motor Gear Ratio	Index 0x6410, Sub-Index 33	104
Number of Resolver Cycles/Motor Rev	Index 0x6410, Sub-Index 34	104
Motor Brake Enable Delay Time	Index 0x2199	105
Motor Encoder Wrap	Index 0x2220	105
Load Encoder Wrap	Index 0x2221	105
Motor Encoder Options	Index 0x2222	105
Load Encoder Options	Index 0x2223	106
Motor Encoder Status	Index 0x2224	107
Load Encoder Status	Index 0x2225	108
Phasing Mode	Index 0x21C0	108

Real-time Amplifier and Motor Status Objects

Analog/Digital Reference Input Value	Index 0x2200	111
High Voltage Reference	Index 0x2201	111
Amplifier Temperature	Index 0x2202	111
System Time	Index 0x2141	111
Winding A Current	Index 0x2203	111
Winding B Current	Index 0x2204	111
Sine Feedback Voltage	Index 0x2205	111
Cosine Feedback Voltage	Index 0x2206	112
A/D Offset Value	Index 0x2207	112
Current Offset A	Index 0x2210	112
Current Offset B	Index 0x2211	112
Stator Current X	Index 0x2212	112
Stator Voltage- X Axis	Index 0x221A	112
Stator Voltage- Y Axis	Index 0x221B	112
RMS Current Calculation Period	Index 0x2114	113
RMS current over set period	Index 0x2115	113
Motor Phase Angle	Index 0x2260	113
Motor Phase Angle	Index 0x2262	113
Encoder Phase Angle	Index 0x2263	113
Hall State	Index 0x2261	113
Digital Command Input Scaling Factor	Index 0x2321	114

Digital I/O Configuration Objects

Input Pin States Index 0x2190	116
Input Pin State Index 0x219A	116
Input Pin Config register (16 Bit) Index 0x2191	117
Input Pin Config Register (32 bit) Index 0x219C	117
Input Pin Configuration Index 0x2192	118
Input Pin Configuration Index 0x2192, Sub-Index 1-N	118
Input Pin Debounce Values Index 0x2195	119
Input Pin Debounce Values Index 0x2195, Sub-Index 1-N	119
Raw Input Pin Value (16 bit) Index 0x2196	119
Raw Input Pin Value (32 bit) Index 0x219B	119
Output pin configuration Index 0x2193	120
Output Pin Configuration Index 0x2193, Sub-Index 1-N	120
Output States and Program Control Index 0x2194	121
Digital Control Input Configuration Index 0x2320	121
Digital Control Input Scaling Index 0x2321	122
Digital Inputs Index 0x60FD	122
Configure I/O Options Index 0x2198	122

Position Loop Configuration Objects

Instantaneous Commanded Velocity Index 0x2250	136
Instantaneous Commanded Acceleration Index 0x2251	136
Position Command Value Index 0x6062	136
Position Actual Value Index 0x6063	136
Position Actual Value Index 0x6064	136
Tracking Warning Window Index 0x6065	137
Maximum Slippage-Profile Velocity Mode Index 0x60F8	137
Position Tracking Window Index 0x6067	137
Position Tracking Window Time Index 0x6068	137
Position Error Index 0x60F4	138
Position Loop Control Effort Index 0x60FA	138
Position Loop Gains Index 0x2382	138
Position Loop Proportional Gain Index 0x2382, Sub-Index 1	138
Position Loop Velocity Feed Forward Index 0x2382, Sub-Index 2	138
Position Loop Acceleration Feed Forward Index 0x2382, Sub-Index 3	139
Position Loop Output Gain Multiplier Index 0x2382, Sub-Index 4	139
Position Loop Gains Index 0x60FB	139
Position Loop Proportional Gain Index 0x60FB, Sub-Index 1	139
Position Loop Velocity Feed Forward Index 0x60FB, Sub-Index 2	139
Position Loop Acceleration Feed Forward Index 0x60FB, Sub-Index 3	140
Position Loop Output Gain Multiplier Index 0x60FB, Sub-Index 4	140
Position Command Value Index 0x60FC	140
Software Position Limits Index 0x607D	140
Negative Software Limit Position Index 0x607D, Sub-Index 1	140
Positive Software Limit Position Index 0x607D, Sub-Index 2	140
Software Limit Deceleration Index 0x2253	141
Motor Encoder Position Index 0x2240	141
Load Encoder Position Index 0x2242	141
Minimum PWM Pulse Width Index 0x2323	141
Maximum PWM Pulse Width Index 0x2324	141

Velocity Loop Configuration Objects

Velocity Command Value Index 0x606B	143
Actual Velocity Index 0x6069	143
Actual Velocity Index 0x606C	143
Unfiltered Motor Encoder Velocity Index 0x2232	143
Load Encoder Velocity Index 0x2231	143
Velocity Loop Maximum Acceleration Index 0x2100	143
Velocity Loop Maximum Deceleration Index 0x2101	144
Velocity Loop Emergency Stop Deceleration Index 0x2102	144
Velocity Loop – Maximum Velocity Index 0x2103	144
Velocity Error Window – Profile Position Index 0x2104	144
Velocity Error Window – Profile Velocity Index 0x606D	144
Velocity Error Window Time Index 0x2105	145
Velocity Error Window Time Index 0x606E	145
Limited Velocity Index 0x2230	145
Programmed Velocity Command Index 0x2341	145
Velocity Loop Gains Index 0x2381	145
Velocity Loop Proportional Gain Index 0x2381, Sub-Index 1	145
Velocity Loop Integral Gain Index 0x2381, Sub-Index 2	146
Velocity Loop Acceleration Feed Forward Index 0x2381, Sub-Index 3	146
Velocity Loop Gain Scaler Index 0x2381, Sub-Index 4	146
Velocity Loop Vi Drain (Integral Bleed) Index 0x2381, Sub-Index 5	146
Velocity Loop Command Feed Index 0x2381, Sub-Index 6	146
Velocity Loop Gains Index 0x60F9	146
Velocity Loop Proportional Gain Index 0x60F9, Sub-Index 1	146
Velocity Loop Integral Gain Index 0x60F9, Sub-Index 2	147
Velocity Loop Acceleration Feed Forward Index 0x60F9, Sub-Index 3	147
Velocity Loop Gain Scaler Index 0x60F9, Sub-Index 4	147
Velocity Loop Vi Drain (Integral Bleed) Index 0x60F9, Sub-Index 5	147
Velocity Loop Command Feed Index 0x60F9, Sub-Index 6	147
Hall Velocity Mode Shift Value Index 0x2107	147
Velocity Loop Output Filter Coefficients Index 0x2106	148
Velocity Loop Command Filter Coefficients Index 0x2108	148
Analog Input Filter Coefficients Index 0x2109	148

Current Loop Configuration Objects

User Peak Current Limit Index 0x2110	150
User Continuous Current Limit Index 0x2111	150
User Peak Current Limit Time Index 0x2112	150
Actual Current, D Axis Index 0x2214	150
Actual Current, Q Axis Index 0x2215	150
Current Command, D Axis Index 0x2216	150
Current Command, Q Axis Index 0x2217	150
Current Loop Output, D Axis Index 0x2218	151
Current Loop Output, Q Axis Index 0x2219	151
Actual Motor Current Index 0x221C	151
Commanded Current Index 0x221D	151
Limited Current Index 0x221E	151
Programmed Current Command Index 0x2340	151
Commanded Current Ramp Rate Index 0x2113	151
Current Loop Gains Index 0x2380	152
Current Loop Proportional Gain Index 0x2380, Sub-Index 1	152
Current Loop Integral Gain Index 0x2380, Sub-Index 2	152
Current Offset Index 0x2380, Sub-Index 3	152
Current Loop Gains Index 0x60F6	152
Current Loop Proportional Gain Index 0x60F6, Sub-Index 1	152
Current Loop Integral Gain Index 0x60F6, Sub-Index 2	152
Current Offset Index 0x60F6, Sub-Index 3	153

Stepper Mode Objects

Boost Current	Index 0x2110	161
Run Current	Index 0x2111	161
Time at Boost Current	Index 0x2112	161
Hold Current	Index 0x21D0	161
Run to Hold Time	Index 0x21D1	161
Detent Correction Gain Factor For Microstepping Mode	Index 0x21D2	161
Voltage Control Mode Time Delay	Index 0x21D5	162
Stepper Configuration and Status	Index 0x21D6	162
Maximum Velocity Adjustment	Index 0x21D8	162
Proportional Gain For Stepper Outer Loop	Index 0x21D7	162

Homing Mode Operation Objects

Homing Method	Index 0x6098	183
Homing Speeds	Index 0x6099	184
Home Velocity – Fast	Index 0x6099, Sub-Index 1	184
Home Velocity – Slow	Index 0x6099, Sub-Index 2	184
Homing Acceleration	Index 0x609A	184
Home Offset	Index 0x607C	184
Hard Stop Mode Home Delay	Index 0x2351	185
Hard Stop Mode Home Current	Index 0x2350	185
Home Config	Index 0x2352	185
Position Capture Control Register	Index 0x2400	186
Position Capture Status Register	Index 0x2401	186
Captured Index Position	Index 0x2402	187
Home Capture Position	Index 0x2403	187
Time Stamp of Last High Speed Position Capture	Index 0x2404	187
Captured Position for High Speed Position Capture	Index 0x2405	187
Homing Adjustment	Index 0x2353	187

Profile Mode Objects

Trajectory Jerk Limit	Index 0x2121	201
Trajectory Generator Status	Index 0x2252	201
Trajectory Generator Destination Position	Index 0x2122	201
Target Position	Index 0x607A	201
Profile Velocity	Index 0x6081	202
Target Velocity	Index 0x60FF	202
Target Torque	Index 0x6071	202
Torque Command	Index 0x6074	202
Motor Rated Torque	Index 0x6076	202
Torque Actual Value	Index 0x6077	202
Torque Slope	Index 0x6087	203
Torque Profile Type	Index 0x6088	203
Profile Acceleration	Index 0x6083	203
Profile Deceleration	Index 0x6084	203
Quick Stop Deceleration	Index 0x6085	204
Motion Profile Type	Index 0x6086	204
Velocity Sensor Selection	Index 0x606A	204

Interpolated Position Mode Objects

IP move segment command	Index 0x2010	213
Trajectory Buffer Free Count	Index 0x2011	214
Trajectory Buffer Status	Index 0x2012	215
Next Trajectory Segment ID	Index 0x2013	215
Interpolation Submode Select	Index 0x60C0	215
Interpolation Data Record	Index 0x60C1	216
Interpolation Position Target	Index 0x60C1, Sub-Index 1	216
Interpolation Time	Index 0x60C1, Sub-Index 2	216
Interpolation Velocity	Index 0x60C1, Sub-Index 3	216
Interpolation Constant Time	Index 0x60C2	217
Interpolation Constant Time Index	Index 0x60C2, Sub-Index 1	217
Interpolation Constant Time Units	Index 0x60C2, Sub-Index 2	217

Alternative Control Source Objects

Micro-Stepping Rate	Index 0x21C1	226
Analog Reference Scaling Factor	Index 0x2310	226
Analog Reference Offset	Index 0x2311	226
Analog Reference Calibration Offset	Index 0x2312	226
Analog Reference Deadband	Index 0x2313	226
Secondary Analog Reference Value	Index 0x2208	226
Motor Temp Sensor Voltage	Index 0x2209	227
Motor Temp Sensor Limit	Index 0x220A	227
PWM Input Frequency	Index 0x2322	227
Function Generator Configuration	Index 0x2330	227
Function Generator Frequency	Index 0x2331	228
Function Generator Amplitude	Index 0x2332	228
Function Generator Duty Cycle	Index 0x2333	228
Camming Configuration	Index 0x2360	228
Cam Delay Forward	Index 0x2361	229
Cam Delay Reverse	Index 0x2362	229
Cam Master Velocity	Index 0x2363	229
Trace Buffer Reserved Size	Index 0x250A	229
Trace Buffer Address	Index 0x250B	229
Trace Buffer Data	Index 0x250C	229
Indexer Register Values	Index 0x2600	230
Indexer Register Values	Index 0x2600, Sub-Index 1-32	230

Trace Tool Objects

Trace Channels	Index 0x2500	238
Trace Channels	Index 0x2500, Sub-Index 1-6	238
Trace Status	Index 0x2501	239
Trace Reference Period	Index 0x2502	239
Trace Period	Index 0x2505	239
Trace Sample Count	Index 0x2503	240
Trace Max Samples	Index 0x2504	240
Trace Trigger Configuration	Index 0x2506	240
Trace Delay	Index 0x2507	241
Trace Start/Stop	Index 0x2508	241
Trace Data	Index 0x2509	241

APPENDIX

D: OBJECTS BY INDEX ID

This chapter lists the objects in order of index ID. Bold page numbers indicate that the top-level object's general description appears on that page. Regular page numbers indicate that a reference to the object (or one of its sub-objects) appears on that page.

0x1000, 72, 73, 87	0x2100, 132, 143	0x2193, 120 , 121
